

AMC1306x Small, High-Precision, Reinforced Isolated Delta-Sigma Modulators with High CMTI

1 Features

- Pin-Compatible Family Optimized for Shunt-Resistor-Based Current Measurements:
 - ± 50 -mV or ± 250 -mV Input Voltage Ranges
 - Manchester Coded or Uncoded Bitstream Options
- Excellent DC Performance:
 - Offset Error: ± 50 μ V or ± 100 μ V (max)
 - Offset Drift: 1 μ V/ $^{\circ}$ C (max)
 - Gain Error: $\pm 0.2\%$ (max)
 - Gain Drift: ± 40 ppm/ $^{\circ}$ C (max)
- Transient Immunity: 100 kV/ μ s (typ)
- System-Level Diagnostic Features
- Safety-Related Certifications:
 - 7000- V_{PEAK} Reinforced Isolation per DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01
 - 5000- V_{RMS} Isolation for 1 Minute per UL1577
 - CAN/CSA No. 5A-Component Acceptance Service Notice, IEC 60950-1, and IEC 60065 End Equipment Standards
- Fully Specified Over the Extended Industrial Temperature Range: -40° C to $+125^{\circ}$ C

2 Applications

- Shunt-Resistor-Based Current Sensing and Isolated Voltage Measurements in:
 - Industrial Motor Drives
 - Photovoltaic Inverters
 - Uninterruptible Power Supplies

3 Description

The AMC1306 device is a precision, delta-sigma ($\Delta\Sigma$) modulator with the output separated from the input circuitry by a capacitive double isolation barrier that is highly resistant to magnetic interference. This barrier is certified to provide reinforced isolation of up to 7000 V_{PEAK} according to the DIN V VDE V 0884-11 and UL1577 standards. Used in conjunction with isolated power supplies, this isolated modulator separates parts of the system that operate on different common-mode voltage levels and protects lower-voltage parts from damage.

The input of the AMC1306 is optimized for direct connection to shunt resistors or other low voltage-level signal sources. The unique low input voltage range of the ± 50 -mV device allows significant reduction of the power dissipation through the shunt and supports excellent ac and dc performance. The output bitstream of the AMC1306 is Manchester coded (AMC1306Ex) or uncoded (AMC1306Mx), depending on the derivate. By using an integrated digital filter (such as those in the [TMS320F2807x](#) or [TMS320F2837x](#) microcontroller families) to decimate the bitstream, the device can achieve 16 bits of resolution with a dynamic range of 85 dB at a data rate of 78 kSPS.

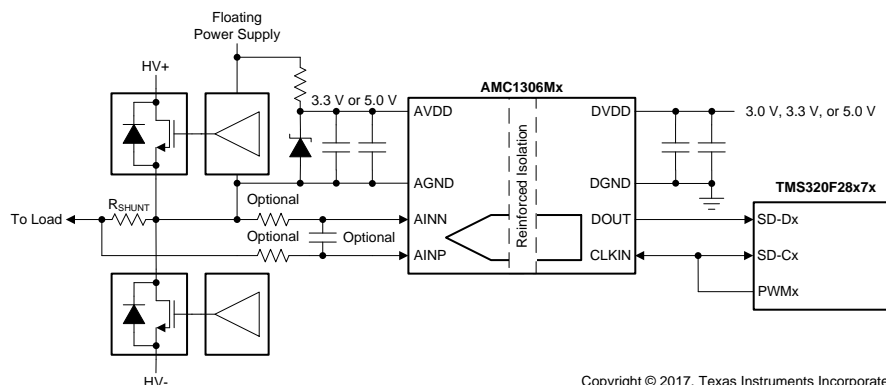

The bitstream output of the Manchester coded AMC1306Ex versions support single-wire data and clock transfer without having to consider the setup and hold time requirements of the receiving device.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
AMC1306x	SOIC (8)	5.85 mm x 7.50 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

Changes from Original (March 2017) to Revision A	Page
• Released AMC1306E05 and AMC1306M05 to production	1
• Added $\pm 50 \mu\text{V}$ to first <i>DC Performance</i> sub-bullet to reflect the AMC1306x05 devices	1
• Changed standard deviation from 0884-10 to 0884-11 in first <i>Safety-Related Certifications</i> sub-bullet	1
• Changed V_{PEAK} from 8000 to 7000 and standard deviation from 0884-10 to 0884-11 in first paragraph of <i>Description</i> section	1
• Deleted Status column from <i>Device Comparison Table</i>	3
• Changed standard deviation from 0884-10 to 0884-11 in <i>DIN V VDE V 0884-11</i> section of <i>Insulation Specifications</i> table	5
• Changed standard deviation from 0884-10 to 0884-11 in <i>Safety-Related Certifications</i> table	6
• Changed <i>prevent</i> to <i>minimize</i> in condition statement of <i>Safety Limiting Values</i> table	6
• Added <i>Electrical Characteristics: AMC1306x05</i> table	7
• Changed test conditions of Analog Inputs test conditions from $(A\text{INP} - A\text{INN}) / 2$ to $AGND$ to $(A\text{INP} + A\text{INN}) / 2$ to $AGND$ to include all possible conditions	9
• Changed I_{IB} test condition from <i>Inputs shorted to AGND</i> to $A\text{INP} = A\text{INN} = AGND, I_{\text{IB}} = I_{\text{IBP}} + I_{\text{IBN}}$	9
• Added $A\text{INP} = A\text{INN} = AGND$ to E_{O} parameter test conditions	9
• Changed minus sign to plus or minus sign in typical specification of E_{G} parameter	9
• Changed <i>10% to 90%</i> to <i>90% to 10%</i> in test conditions of t_{r} parameter	11
• Added AMC1306x05 devices to <i>Typical Characteristics</i> section	13

5 Device Comparison Table

PART NUMBER	INPUT VOLTAGE RANGE	DIFFERENTIAL INPUT RESISTANCE	DIGITAL OUTPUT INTERFACE
AMC1306E05	±50 mV	4.9 kΩ	Manchester coded CMOS
AMC1306E25	±250 mV	22 kΩ	Manchester coded CMOS
AMC1306M05	±50 mV	4.9 kΩ	Uncoded CMOS
AMC1306M25	±250 mV	22 kΩ	Uncoded CMOS

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	AVDD	—	Analog (high-side) power supply, 3.0 V to 5.5 V. See the Power Supply Recommendations section for decoupling recommendations.
2	AINP	I	Noninverting analog input
3	AINN	I	Inverting analog input
4	AGND	—	Analog (high-side) ground reference
5	DGND	—	Digital (controller-side) ground reference
6	DOUT	O	Modulator data output. This pin is a Manchester coded output for AMC1306Ex derivatives.
7	CLKIN	I	Modulator clock input: 5 MHz to 21 MHz (5-V operation) with internal pulldown resistor (typical value: 1.5 MΩ)
8	DVDD	—	Digital (controller-side) power supply, 2.7 V to 5.5 V. See the Power Supply Recommendations section for decoupling recommendations.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	AVDD to AGND or DVDD to DGND	-0.3	6.5	V
Analog input voltage at AINP, AINN		AGND - 6	AVDD + 0.5	V
Digital input or output voltage at CLKIN or DOUT		DGND - 0.5	DVDD + 0.5	V
Input current to any pin except supply pins		-10	10	mA
Junction temperature, T _J			150	°C
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
AVDD	Analog (high-side) supply voltage (AVDD to AGND)	3.0	5.0	5.5	V
DVDD	Digital (controller-side) supply voltage (DVDD to DGND)	2.7	3.3	5.5	V
T _A	Operating ambient temperature	-40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		AMC1306x	UNIT
		DWV (SOIC)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	112.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	47.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	60.0	°C/W
ψ _{JT}	Junction-to-top characterization parameter	23.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter	60.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Power Ratings

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
P _D	AMC1306Ex, AVDD = DVDD = 5.5 V			91.85	mW
	AMC1306Mx, AVDD = DVDD = 5.5 V			86.90	
P _{D1}	AVDD = 5.5 V			53.90	mW
P _{D2}	AMC1306Ex, DVDD = 5.5 V			37.95	mW
	AMC1306Mx, DVDD = 5.5 V			33.00	

7.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 9	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 9	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the double insulation (2 × 0.0105 mm)	≥ 0.021	mm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300 V _{RMS}	I-IV	
		Rated mains voltage ≤ 600 V _{RMS}	I-IV	
		Rated mains voltage ≤ 1000 V _{RMS}	I-III	
DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	At ac voltage (bipolar)	2121	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At ac voltage (sine wave)	1500	V _{RMS}
		At dc voltage	2121	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 s (qualification test)	7000	V _{PK}
		V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test)	8400	
V _{IOSM}	Maximum surge isolation voltage ⁽³⁾	Test method per IEC 60065, 1.2/50-μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 12800 V _{PK} (qualification)	8000	V _{PK}
q _{pd}	Apparent charge ⁽⁴⁾	Method a, after input/output safety test subgroup 2/3, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.2 × V _{IORM} = 2545 V _{PK} , t _m = 10 s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.6 × V _{IORM} = 3394 V _{PK} , t _m = 10 s	≤ 5	
		Method b1, at routine test (100% production) and preconditioning (type test), V _{ini} = V _{IOTM} , t _{ini} = 1 s, V _{pd(m)} = 1.875 × V _{IORM} = 3977 V _{PK} , t _m = 1 s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁵⁾	V _{IO} = 0.5 V _{PP} at 1 MHz	~1	pF
R _{IO}	Insulation resistance, input to output ⁽⁵⁾	V _{IO} = 500 V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500 V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		40/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} = 5000 V _{RMS} or 7000 V _{DC} , t = 60 s (qualification), V _{TEST} = 1.2 × V _{ISO} = 6000 V _{RMS} , t = 1 s (100% production test)	5000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves and ribs on the PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier are tied together, creating a two-pin device.

7.7 Safety-Related Certifications

VDE	UL
Certified according to DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01, DIN EN 60950-1 (VDE 0805 Teil 1): 2014-08, and DIN EN 60065 (VDE 0860): 2005-11	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Reinforced insulation	Single protection
File number: DIN 40040142	File number: E181974

7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output (I/O) circuitry. A failure of the I/O may allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S Safety input, output, or supply current	$\theta_{JA} = 112.2^{\circ}\text{C}/\text{W}$, AVDD = DVDD = 5.5 V, T _J = 150°C, T _A = 25°C			202.5	mA
	$\theta_{JA} = 112.2^{\circ}\text{C}/\text{W}$, AVDD = DVDD = 3.6 V, T _J = 150°C, T _A = 25°C			309.4	
P _S Safety input, output, or total power	$\theta_{JA} = 112.2^{\circ}\text{C}/\text{W}$, T _J = 150°C, T _A = 25°C			1114 ⁽¹⁾	mW
T _S Maximum safety temperature				150	°C

(1) Input, output, or the sum of input and output power must not exceed this value.

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7.9 Electrical Characteristics: AMC1306x05

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $AVDD = 3.0\text{ V}$ to 5.5 V , $DVDD = 2.7\text{ V}$ to 5.5 V , $AINP = -50\text{ mV}$ to 50 mV , $AINN = AGND$, and sinc³ filter with $OSR = 256$ (unless otherwise noted); typical specifications are at $T_A = 25^\circ\text{C}$, $CLKIN = 20\text{ MHz}$, $AVDD = 5\text{ V}$, and $DVDD = 3.3\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUTS						
$V_{Clipping}$	Differential input voltage before clipping output	$V_{IN} = AINP - AINN$		±64		mV
FSR	Specified linear differential full-scale	$V_{IN} = AINP - AINN$	-50		50	mV
	Absolute common-mode input voltage ⁽¹⁾	$(AINP + AINN) / 2$ to AGND	-2		AVDD	V
V_{CM}	Operating common-mode input voltage	$(AINP + AINN) / 2$ to AGND	-0.032		AVDD - 2.1	V
V_{CMov}	Common-mode overvoltage detection level ⁽²⁾	$(AINP + AINN) / 2$ to AGND	AVDD - 2			V
C_{IN}	Single-ended input capacitance	$AINN = AGND$		4		pF
C_{IND}	Differential input capacitance			2		pF

E_O	Offset error	Initial, at 25°C , $AINP = AINN = AGND$	-50	±2.5	50	µV
TCE_O	Offset error thermal drift ⁽⁵⁾		-1	±0.25	1	µV/°C
E_G	Gain error	Initial, at 25°C	-0.2%	±0.005%	0.2%	
TCE_G	Gain error thermal drift ⁽⁶⁾		-40	±20	40	ppm/°C
PSRR	Power-supply rejection ratio	$AINP = AINN = AGND$, $3.0\text{ V} \leq AVDD \leq 5.5\text{ V}$, at dc		-108		dB
		$AINP = AINN = AGND$, $3.0\text{ V} \leq AVDD \leq 5.5\text{ V}$, 10 kHz, 100-mV ripple		-107		
AC ACCURACY						
SNR	Signal-to-noise ratio	$f_{IN} = 1\text{ kHz}$	78	82.5		dB
SINAD	Signal-to-noise + distortion	$f_{IN} = 1\text{ kHz}$	77.5	82.3		dB
THD	Total harmonic distortion	$4.5\text{ V} \leq AVDD \leq 5.5\text{ V}$, $5\text{ MHz} \leq f_{CLKIN} \leq 21\text{ MHz}$, $f_{IN} = 1\text{ kHz}$		-98	-84	dB
		$3.0\text{ V} \leq AVDD \leq 3.6\text{ V}$, $5\text{ MHz} \leq f_{CLKIN} \leq 20\text{ MHz}$, $f_{IN} = 1\text{ kHz}$		-93	-83	
SFDR	Spurious-free dynamic range	$f_{IN} = 1\text{ kHz}$	83	100		dB

- (1) Steady-state voltage supported by the device in case of a system failure. See specified common-mode input voltage V_{CM} for normal operation. Observe analog input voltage range as specified in the [Absolute Maximum Ratings](#) table.
- (2) The common-mode overvoltage detection level has a typical hysteresis of 90 mV.
- (3) This is the -3-dB, second-order roll-off frequency of the integrated differential input amplifier to consider for the antialiasing filter design.
- (4) Integral nonlinearity is defined as the maximum deviation from a straight line passing through the end-points of the ideal ADC transfer function expressed as a number of LSBs or as a percent of the specified linear full-scale range (FSR).
- (5) Offset error drift is calculated using the box method, as described by the following equation:

$$TCE_O = \frac{value_{MAX} - value_{MIN}}{TempRange}$$

- (6) Gain error drift is calculated using the box method, as described by the following equation:

$$TCE_G (ppm) = \left(\frac{value_{MAX} - value_{MIN}}{value \times TempRange} \right) \times 10^6$$

Electrical Characteristics: AMC1306x05 (continued)

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $AVDD = 3.0\text{ V}$ to 5.5 V , $DVDD = 2.7\text{ V}$ to 5.5 V , $A_{INP} = -50\text{ mV}$ to 50 mV , $A_{INN} = \text{AGND}$, and sinc³ filter with $\text{OSR} = 256$ (unless otherwise noted); typical specifications are at $T_A = 25^\circ\text{C}$, $\text{CLKIN} = 20\text{ MHz}$, $AVDD = 5\text{ V}$, and $DVDD = 3.3\text{ V}$

8 Detailed Description

8.1 Overview

The differential analog input (comprised of input signals AINP and AINN) of the AMC1306 is a fully-differential amplifier feeding the switched-capacitor input of a second-order, delta-sigma ($\Delta\Sigma$) modulator stage that digitizes the input signal into a 1-bit output stream. The isolated data output DOUT of the converter provides a stream of digital ones and zeros that is synchronous to the externally-provided clock source at the CLKIN pin with a frequency in the range of 5 MHz to 21 MHz. The time average of this serial bitstream output is proportional to the analog input voltage.

The [Functional Block Diagram](#) section shows a detailed block diagram of the AMC1306. The analog input range is tailored to directly accommodate a voltage drop across a shunt resistor used for current sensing. The silicon-dioxide (SiO_2) based capacitive isolation barrier supports a high level of magnetic field immunity as described in the [ISO72x Digital Isolator Magnetic-Field Immunity](#) application report, available for download at www.ti.com. The external clock input simplifies the synchronization of multiple current-sensing channels on the system level. The extended frequency range of up to 21 MHz supports higher performance levels compared to the other solutions available on the market.

8.3 Feature Description

8.3.1 Analog Input

The AMC1306 incorporates front-end circuitry that contains a differential amplifier and a sampling stage, followed by a $\Delta\Sigma$ modulator. The gain of the differential amplifier is set by internal precision resistors to a factor of 4 for devices with a specified input voltage range of ± 250 mV (this value is for the AMC1306x25), or to a factor of 20 in devices with a ± 50 -mV input voltage range (for the AMC1306x05), resulting in a differential input impedance of 4.9 k Ω (for the AMC1306x05) or 22 k Ω (for the AMC1306x25). For reduced offset and offset drift, the differential amplifier is chopper-stabilized with the switching frequency set at $f_{CLKIN} / 32$. The switching frequency generates a spur as shown in Figure 47.

sinc^3 filter, $\text{OSR} = 2$, $f_{CLKIN} = 20$ MHz, $f_{IN} = 1$ kHz

Figure 47. Quantization Noise Shaping

Consider the input impedance of the AMC1306 in designs with high-impedance signal sources that can cause degradation of gain and offset specifications. The importance of this effect, however, depends on the desired system performance. Additionally, the input bias current caused by the internal common-mode voltage at the output of the differential amplifier is dependent on the actual amplitude of the input signal; see the [Isolated Voltage Sensing](#) section for more details on reducing these effects.

There are two restrictions on the analog input signals (AINP and AINN). First, if the input voltage exceeds the range $\text{AGND} - 6$ V to $\text{AVDD} + 0.5$ V, the input current must be limited to 10 mA because the device input electrostatic discharge (ESD) diodes turn on. In addition, the linearity and noise performance of the device are ensured only when the differential analog input voltage remains within the specified linear full-scale range (FSR), that is ± 250 mV (for the AMC1306x25) or ± 50 mV (for the AMC1306x05), and within the specified input common-mode range.

Feature Description (continued)

8.3.2 Modulator

The modulator implemented in the AMC1306 is a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator, such as the one conceptualized in Figure 48. The analog input voltage V_{IN} and the output V_5 of the 1-bit digital-to-analog converter (DAC) are differentiated, providing an analog voltage V_1 at the input of the first integrator stage. The output of the first integrator feeds the input of the second integrator stage, resulting in output voltage V_3 that is differentiated with the input signal V_{IN} and the output of the first integrator V_2 . Depending on the polarity of the resulting voltage V_4 , the output of the comparator is changed. In this case, the 1-bit DAC responds on the next clock pulse by changing the associated analog output voltage V_5 , causing the integrators to progress in the opposite direction and forcing the value of the integrator output to track the average value of the input.

Figure 48. Block Diagram of a Second-Order Modulator

The modulator shifts the quantization noise to high frequencies, as shown in Figure 48. Therefore, use a low-pass digital filter at the output of the device to increase the overall performance. This filter is also used to convert from the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation). TI's microcontroller families [TMS320F2807x](#) and [TMS320F2837x](#) offer a suitable programmable, hardwired filter structure termed a *sigma-delta filter module* (SDFM) optimized for usage with the AMC1306 family. Also, SD24_B converters on the [MSP430F677x](#) microcontrollers offer a path to directly access the integrated sinc-filters for a simple system-level solution for multichannel, isolated current sensing. An additional option is to use a suitable application-specific device, such as the [AMC1210](#) (a four-channel digital sinc-filter). Alternatively, a field-programmable gate array (FPGA) can be used to implement the filter.

Feature Description (continued)

8.3.3 Isolation Channel Signal Transmission

The AMC1306 device uses an on-off keying (OOK) modulation scheme to transmit the modulator output bitstream across the capacitive SiO₂-based isolation barrier. The transmitter modulates the bitstream at TX IN in Figure 49 with an internally-generated, 480-MHz carrier across the isolation barrier to represent a digital *one* and sends a *no signal* to represent the digital *zero*. The receiver demodulates the signal after advanced signal conditioning and produces the output. The symmetrical design of each isolation channel improves the CMTI performance and reduces the radiated emissions caused by the high-frequency carrier. The block diagram of an isolation channel integrated in the AMC1306 is shown in Figure 49.

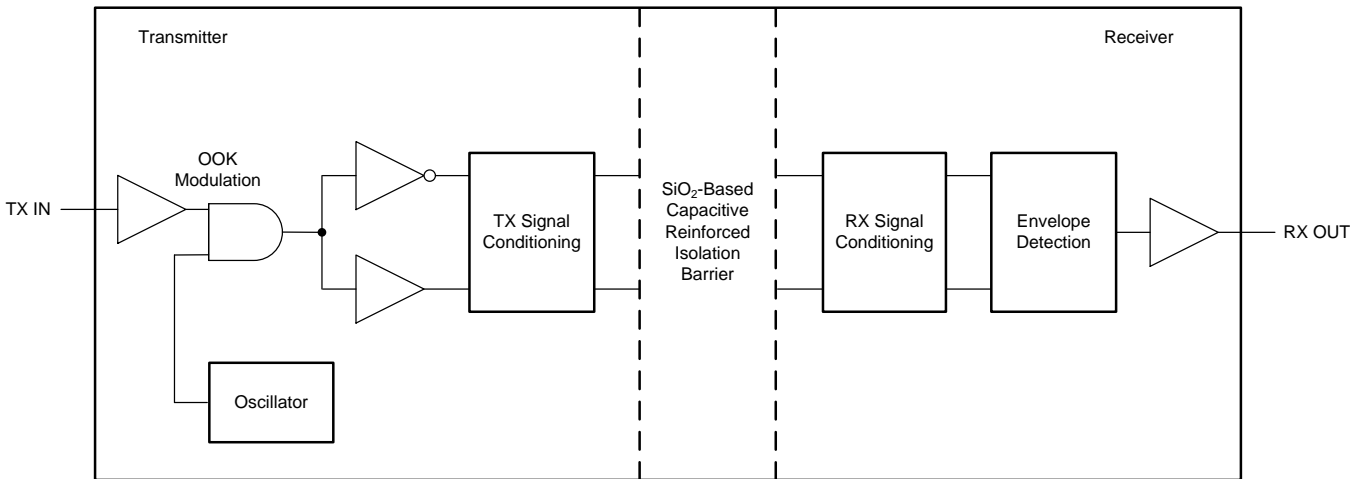

Figure 49. Block Diagram of an Isolation Channel

Figure 50 shows the concept of the on-off keying scheme.

Figure 50. OOK-Based Modulation Scheme

Feature Description (continued)

8.3.4 Digital Output

A differential input signal of 0 V ideally produces a stream of ones and zeros that are high 50% of the time. A differential input of 250 mV (for the AMC1306x25) or 50 mV (for the AMC1306x05) produces a stream of ones and zeros that are high 89.06% of the time. With 16 bits of resolution, that percentage ideally corresponds to the code 58368. A differential input of –250 mV (–50 mV for the AMC1306x05) produces a stream of ones and zeros that are high 10.94% of the time and ideally results in code 7168 with 16-bit resolution. These input voltages are also the specified linear ranges of the different AMC1306 versions with performance as specified in this document. If the input voltage value exceeds these ranges, the output of the modulator shows nonlinear behavior when the quantization noise increases. The output of the modulator clips with a stream of only zeros with an input less than or equal to –320 mV (–64 mV for the AMC1306x05) or with a stream of only ones with an input greater than or equal to 320 mV (64 mV for the AMC1306x05). In this case, however, the AMC1306 generates a single 1 (if the input is at negative full-scale) or 0 every 128 clock cycles to indicate proper device function (see the [Fail-Safe Output](#) section for more details). The input voltage versus the output modulator signal is shown in [Figure 51](#).

Figure 51. Analog Input versus the AMC1306 Modulator Output

The density of ones in the output bitstream for any input voltage value (with the exception of a full-scale input signal, as described in the [Output Behavior in Case of a Full-Scale Input](#) section) can be calculated using [Equation 1](#):

$$\frac{V_{IN} + V_{Clipping}}{2 \times V_{Clipping}} \quad (1)$$

The AMC1306 system clock is provided externally at the CLKIN pin. For more details, see the [Switching Characteristics](#) table and the [Manchester Coding Feature](#) section.

8.3.5 Manchester Coding Feature

The AMC1306Ex offers the IEEE 802.3-compliant Manchester coding feature that generates at least one transition per bit to support clock signal recovery from the bitstream. A Manchester coded bitstream is free of dc components. The Manchester coding combines the clock and data information using exclusive or (XOR) logical operation and results in a bitstream as shown in [Figure 52](#). The duty cycle of the Manchester encoded bitstream depends on the duty cycle of the input clock CLKIN.

Figure 52. Manchester Coded Output of the AMC1306Ex

8.4 Device Functional Modes

8.4.1 Fail-Safe Output

In the case of a missing high-side supply voltage AVDD, the output of a $\Delta\Sigma$ modulator is not defined and can cause a system malfunction. In systems with high safety requirements, this behavior is not acceptable. Therefore, the AMC1306 implements a fail-safe output function that ensures that the output DOUT of the device offers a steady-state bitstream of logic 0's in case of a missing AVDD, as shown in Figure 53.

Additionally, if the common-mode voltage of the input reaches or exceeds the specified common-mode overvoltage detection level V_{CMov} as defined in the *Electrical Characteristics* table, the AMC1306 offers a steady-state bitstream of logic 1's at the output DOUT, as also shown in Figure 53.

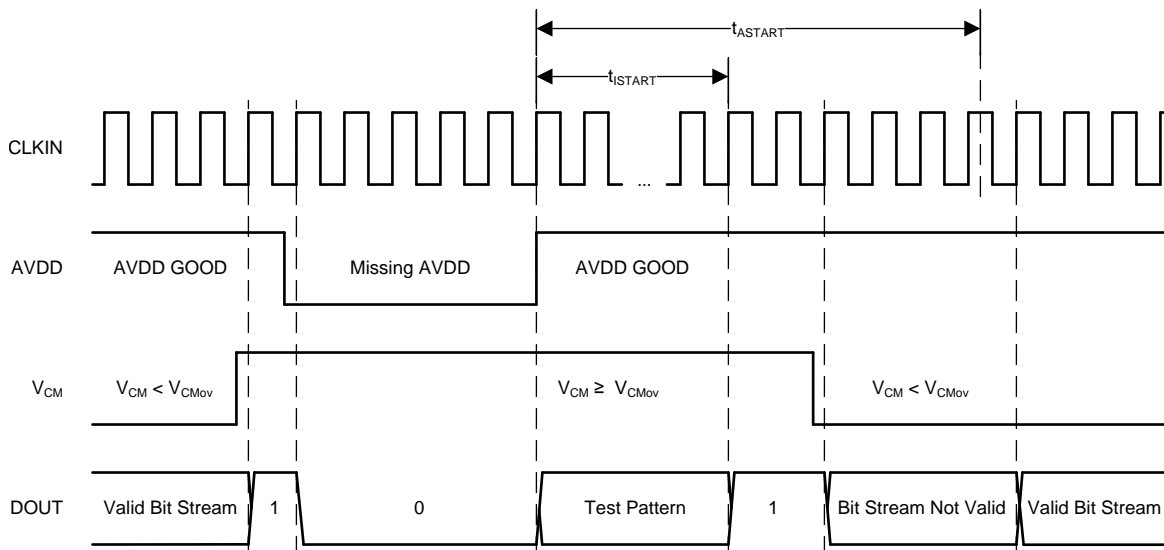

Figure 53. Fail-Safe Output of the AMC1306

8.4.2 Output Behavior in Case of a Full-Scale Input

If a full-scale input signal is applied to the AMC1306 (that is, $V_{IN} \geq V_{Clipping}$), the device generates a single one or zero every 128 bits at DOUT, depending on the actual polarity of the signal being sensed, as shown in Figure 54. In this way, differentiating between a missing AVDD and a full-scale input signal is possible on the system level.

Figure 54. Overage Output of the AMC1306

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Digital Filter Usage

The modulator generates a bitstream that is processed by a digital filter to obtain a digital word similar to a conversion result of a conventional analog-to-digital converter (ADC). A very simple filter, built with minimal effort and hardware, is a sinc³-type filter, as shown in [Equation 2](#):

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^3 \quad (2)$$

This filter provides the best output performance at the lowest hardware size (count of digital gates) for a second-order modulator. All the characterization in this document is also done with a sinc³ filter with an oversampling ratio (OSR) of 256 and an output word width of 16 bits.

The effective number of bits (ENOB) is often used to compare the performance of ADCs and $\Delta\Sigma$ modulators. [Figure 55](#) shows the ENOB of the AMC1306 with different oversampling ratios. In this document, this number is calculated from the SNR by using [Equation 3](#):

$$\text{SINAD} = 1.76 \text{ dB} + 6.05 \text{ dB} \times \text{ENOB} \quad (3)$$

Figure 55. Measured Effective Number of Bits versus Oversampling Ratio

An example code for implementing a sinc³ filter in an FPGA is discussed in the [Combining the ADS1202 with an FPGA Digital Filter for Current Measurement in Motor Control Applications](#) application note, available for download at www.ti.com.

9.2 Typical Applications

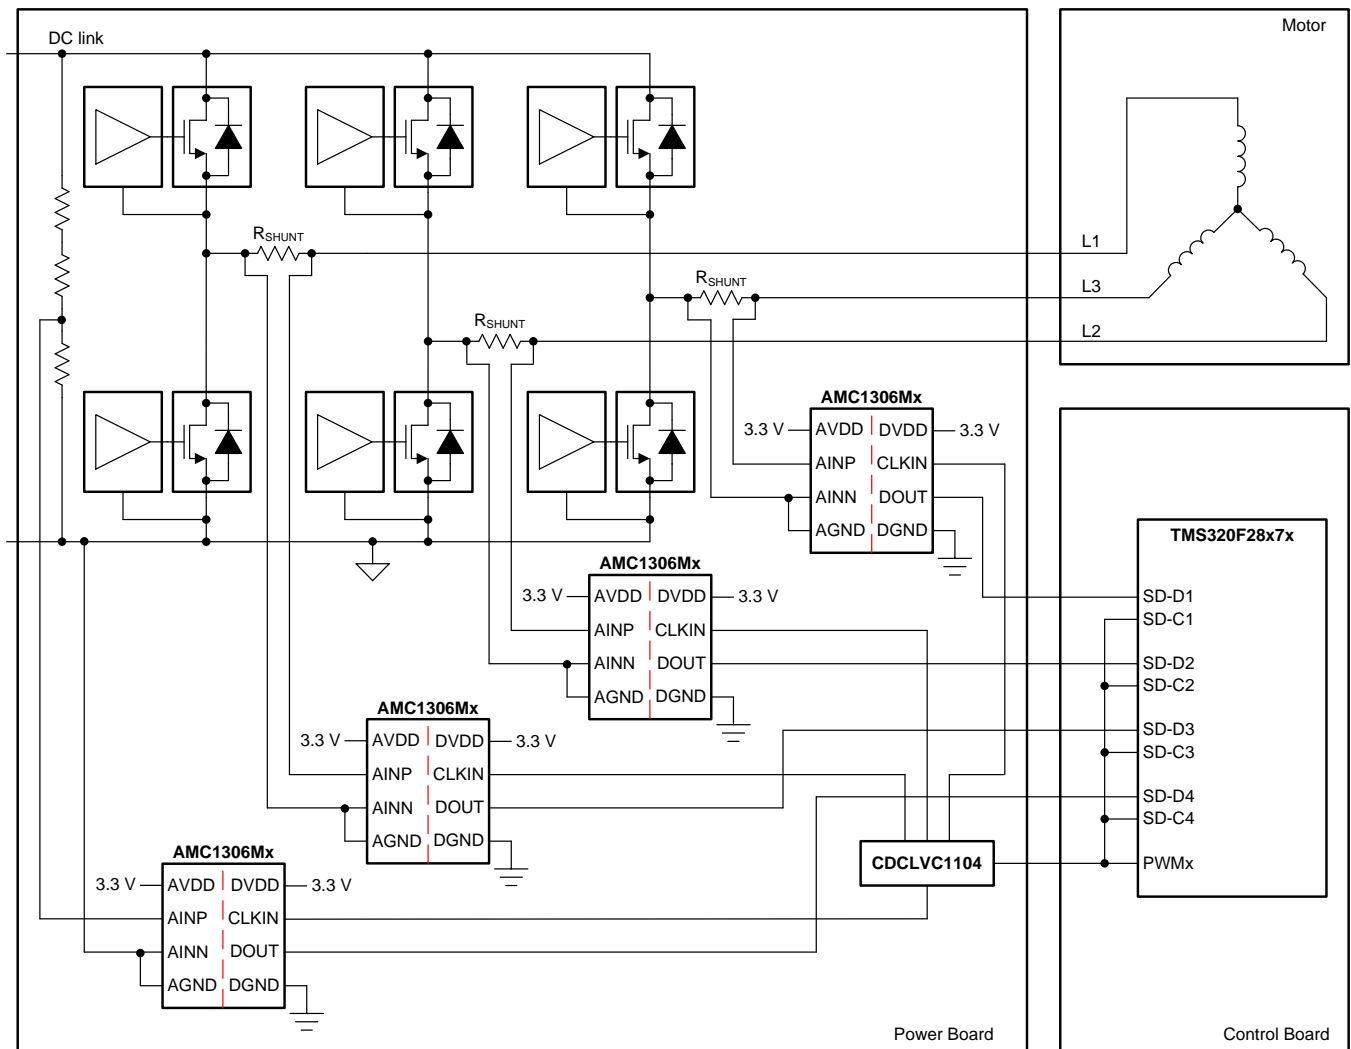

9.2.1 Frequency Inverter Application

Isolated $\Delta\Sigma$ modulators are being widely used in frequency inverter designs because of their high ac and dc performance. Frequency inverters are critical parts of industrial motor drives, photovoltaic inverters (string and central inverters), uninterruptible power supplies (UPS), electrical and hybrid electrical vehicles, and other industrial applications.

Figure 56 shows a simplified schematics of the AMC1306Mx in a typical frequency inverter application as used in industrial motor drives with shunt resistors (R_{SHUNT}) used for current sensing. Depending on the system design, either all three or only two motor phase currents are sensed.

The Manchester coded bitstream output of the AMC1306Ex minimizes the wiring efforts of the connection between the power board and the control board; see Figure 57. This bitstream output also allows the clock to be generated locally on the power board without the having to adjust the propagation delay time of each DOUT connection to fulfill the setup and hold time requirements of the microcontroller.

In both examples, an additional fourth AMC1306 is used to support isolated voltage sensing of the dc link. This high voltage is reduced using a high-impedance resistive divider and is sensed by the device across a smaller resistor. The value of this resistor can degrade the performance of the measurement, as described in the *Isolated Voltage Sensing* section.

Figure 57. The AMC1306Ex in a Frequency Inverter Application

9.2.1.1 Design Requirements

Table 1 lists the parameters for the typical application in the [Frequency Inverter Application](#) section.

Table 1. Design Requirements

PARAMETER	VALUE
High-side supply voltage	3.3 V or 5 V
Low-side supply voltage	3.3 V or 5 V
Voltage drop across the shunt for a linear response	±250 mV (maximum)

9.2.1.2 Detailed Design Procedure

The high-side power supply (AVDD) for the AMC1306 device is derived from the power supply of the upper gate driver. Further details are provided in the [Power Supply Recommendations](#) section.

The floating ground reference (AGND) is derived from one of the ends of the shunt resistor that is connected to the negative input of the AMC1306 (AINN). If a four-pin shunt is used, the inputs of the device are connected to the inner leads and AGND is connected to one of the outer shunt leads.

Use Ohm's Law to calculate the voltage drop across the shunt resistor (V_{SHUNT}) for the desired measured current: $V_{SHUNT} = I \times R_{SHUNT}$.

Consider the following two restrictions to choose the proper value of the shunt resistor R_{SHUNT} :

- The voltage drop caused by the nominal current range must not exceed the recommended differential input voltage range: $V_{SHUNT} \leq \pm 250 \text{ mV}$
- The voltage drop caused by the maximum allowed overcurrent must not exceed the input voltage that causes a clipping output: $|V_{SHUNT}| \leq |V_{Clipping}|$

The typically recommended RC filter in front of a $\Delta\Sigma$ modulator to improve signal-to-noise performance of the signal path is not required for the AMC1306. By design, the input bandwidth of the analog front-end of the device is limited as specified in the [Electrical Characteristics](#) table.

For modulator output bitstream filtering, a device from TI's [TMS320F2807x](#) family of low-cost microcontrollers (MCUs) or [TMS320F2837x](#) family of dual-core MCUs is recommended. These families support up to eight channels of dedicated hardwired filter structures that significantly simplify system level design by offering two filtering paths per channel: one providing high accuracy results for the control loop and one fast response path for overcurrent detection.

9.2.1.3 Application Curve

In motor control applications, a very fast response time for overcurrent detection is required. The time for fully settling the filter in case of a step-signal at the input of the modulator depends on the filter order; that is, a sinc^3 filter requires three data updates for full settling (with $f_{DATA} = f_{CLK} / \text{OSR}$). Therefore, for overcurrent protection, filter types other than sinc^3 can be a better choice; an alternative is the sinc^2 filter. [Figure 58](#) compares the settling times of different filter orders.

The delay time of the sinc filter with a continuous signal is half of the settling time.

Figure 58. Measured Effective Number of Bits versus Settling Time

9.2.2 Isolated Voltage Sensing

The AMC1306 is optimized for usage in current-sensing applications using low-impedance shunts. However, the device can also be used in isolated voltage-sensing applications if the affect of the (usually higher) impedance of the resistor used in this case is considered.

Figure 59. Using the AMC1306 for Isolated Voltage Sensing

9.2.2.1 Design Requirements

Figure 59 shows a simplified circuit typically used in high-voltage-sensing applications. The high impedance resistors (R1 and R2) are used as voltage dividers and dominate the current value definition. The resistance of the sensing resistor R3 is chosen to meet the input voltage range of the AMC1306. This resistor and the differential input impedance of the device (the AMC1306x25 is 22 kΩ, the AMC1306x05 is 4.9 kΩ) also create a voltage divider that results in an additional gain error. With the assumption of R1, R2, and R_{IN} having a considerably higher value than R3, the resulting total gain error can be estimated using Equation 4, with E_G being the gain error of the AMC1306.

$$|E_{G_{tot}}| = |E_G| + \frac{R3}{R_{IN}} \quad (4)$$

This gain error can be easily minimized during the initial system-level gain calibration procedure.

9.2.2.2 Detailed Design Procedure

As indicated in Figure 59, the output of the integrated differential amplifier is internally biased to a common-mode voltage of 1.9 V. This voltage results in a bias current I_B through the resistive network R4 and R5 (or R4' and R5') used for setting the gain of the amplifier. The value range of this current is specified in the [Electrical Characteristics](#) table. This bias current generates additional offset error that depends on the value of the resistor R3. The initial system offset calibration does not minimize this effect because the value of the bias current depends on the actual common-mode amplitude of the input signal (as illustrated in Figure 60). Therefore, in systems with high accuracy requirements, a series resistor is recommended to be used at the negative input (AINN) of the AMC1306 with a value equal to the shunt resistor R3 (that is, R3' = R3 in Figure 59) to eliminate the effect of the bias current.

This additional series resistor (R3') influences the gain error of the circuit. The effect can be calculated using Equation 5 with R5 = R5' = 50 kΩ and R4 = R4' = 2.5 kΩ (for the AMC1306x05) or 12.5 kΩ (for the AMC1306x25).

$$E_G(\%) = \left(1 - \frac{R4}{R4' + R3'} \right) \times 100\% \tag{5}$$

9.2.2.3 Application Curve

Figure 60 shows the dependency of the input bias current on the common-mode voltage at the input of the AMC1306.

Figure 60. Input Bias Current vs Common-Mode Input Voltage

9.2.3 Do's and Don'ts

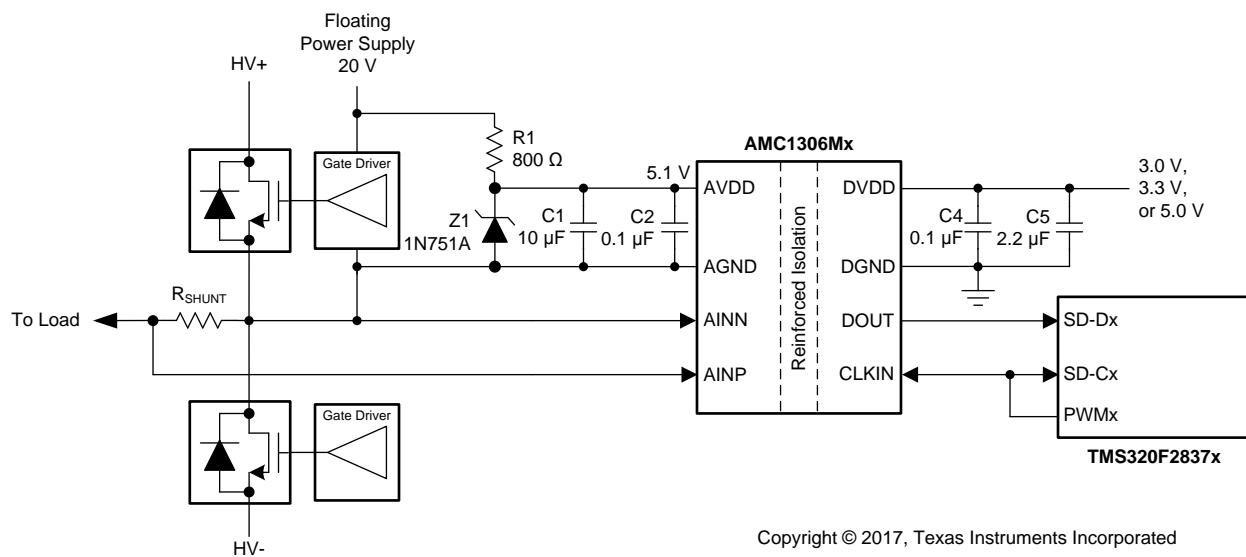

Do not leave the inputs of the AMC1306 unconnected (floating) when the device is powered up. If both modulator inputs are left floating, the input bias current drives these inputs to the output common-mode of the analog front-end of approximately 2 V. If that voltage is above the specified input common-mode range, the front gain diminishes and the modulator outputs a bitstream resembling a zero input differential voltage.

10 Power Supply Recommendations

In a typical frequency-inverter application, the high-side power supply (AVDD) for the device is directly derived from the floating power supply of the upper gate driver. For lowest system-level cost, a Zener diode can be used to limit the voltage to 5 V or 3.3 V ($\pm 10\%$). Alternatively a low-cost low-drop regulator (LDO), for example the LM317-N, can be used to adjust the supply voltage level and minimize noise on the power-supply node. A low-ESR decoupling capacitor of 0.1 μF is recommended for filtering this power-supply path. Place this capacitor (C2 in Figure 61) as close as possible to the AVDD pin of the AMC1306 for best performance. If better filtering is required, an additional 10- μF capacitor can be used.

The floating ground reference (AGND) is derived from the end of the shunt resistor that is connected to the negative input (AINN) of the device. If a four-pin shunt is used, the device inputs are connected to the inner leads and AGND is connected to one of the outer leads of the shunt.

For decoupling of the digital power supply on the controller side, a 0.1- μF capacitor is recommended to be placed as close to the DVDD pin of the AMC1306 as possible, followed by an additional capacitor in the range of 1 μF to 10 μF .

11 Layout

11.1 Layout Guidelines

A layout recommendation showing the critical placement of the decoupling capacitors (as close as possible to the AMC1306) and placement of the other components required by the device is shown in Figure 62. For best performance, place the shunt resistor close to the VINP and VINN inputs of the AMC1306 and keep the layout of both connections symmetrical.

12.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=100ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
