

ASMB-TTF0-0A20B

3735 Tricolor PLCC-6 LED

Overview

The Broadcom® ASMB-TTF0 is a tricolor PLCC6 LED with individually addressable pins for each color. It is designed specifically for outdoor full color display whereby the black outer appearance provides enhanced display contrast without sacrificing its brightness. The short-lead design enables easier potting process.

To facilitate easy pick-and-place assembly, the LEDs are packed in a tape and reel format. Every reel is shipped in single intensity and color bin to ensure uniformity.

Features

- PLCC-6 package with black outer appearance
- Diffused encapsulation
- Compatible with reflow soldering process
- MSL 5a

Applications

- Outdoor full color display

CAUTION!

This LED is ESD sensitive. Please observe appropriate precautions during handling and processing. Refer to application note AN-1142 for additional details.

Figure 1: Package Drawing

Table 1: Pin Configuration

Pin No.	Configuration
1	Red Anode
2	Red Cathode
3	Green Anode
4	Green Cathode
5	Blue Anode
6	Blue Cathode

NOTE:

1. Tolerance is ± 0.20 mm unless otherwise specified.
2. Encapsulation = epoxy.
3. Terminal finish = silver plating.

Absolute Maximum Ratings

Parameters	Red	Green	Blue	Units
DC Forward Current ^a	50	30	30	mA
Peak Forward Current ^b	100	100	100	mA
Power Dissipation	120	108	108	mW
Reverse Voltage	Not recommended for reverse bias			
LED Junction Temperature	105			°C
Operating Temperature Range	-40 to +100			°C
Storage Temperature Range	-40 to +100			°C

a. Derate linearly as shown in Figure 8 and Figure 9.

b. Duty factor = 10%, frequency = 1 kHz.

Optical Characteristics (T_J = 25°C, I_F = 20 mA)

Color	Luminous Intensity, I _V (mcd) ^a			Dominant Wavelength, λ _d (nm) ^b			Peak Wavelength, λ _p (nm)	Viewing Angle, 2θ _{1/2} (°) ^c
	Min.	Typ.	Max.	Min.	Typ.	Max.	Typ.	Typ.
Red	640	710	910	618	620	628	628	110
Green	1600	1840	2210	519	524	529	518	110
Blue	355	410	490	464	471	474	467	110

a. The luminous intensity, I_V is measured at the mechanical axis of LED package and it is tested with mono pulse condition. The actual peak of the spatial radiation pattern may not be aligned with the axis.

b. The dominant wavelength, λ_d is derived from the CIE Chromaticity Diagram and represents the perceived color of the device.

c. θ_{1/2} is the off-axis angle where the luminous intensity is half of the peak intensity.

Electrical Characteristics (T_J = 25°C)

Color	Forward Voltage V _F (V) ^a			Reverse Voltage, V _R (V) at I _R = 10 μA ^b	Thermal Resistance, R _{θJ-S} (°C/W) ^c	
	Min.	Typ.	Max.		1 Chip On	3 Chips On
Red	1.80	2.10	2.40	4.0	314	314
Green	2.70	2.90	3.60	4.0	360	360
Blue	2.70	2.90	3.60	4.0	410	410

a. Tolerance = ± 0.1V.

b. Indicates product final testing. Long term reverse bias is not recommended.

c. Thermal resistance from LED junction to solder point.

Part Numbering System

A S M B - T T x₁ 0 - 0 x₂ x₃ x₄ x₅

Code	Description	Option	
x ₁	Package Type	F	Black outer appearance
x ₂	Minimum Intensity Bin	A	Red: bin J5 Green: bin S2 Blue: bin H2
			Red: bin J5, J6 Green: bin S2, T2 Blue: bin H2, H3
x ₃	Number of Intensity Bins	2	2 intensity bins from minimum
x ₄	Color Bin Combination	0	Red: full distribution Green: bin G, H, P, J, K, L, M, N Blue: bin B, C, D, E, F, W, X, Y
x ₅	Test Option	B	Test Current = 20 mA

Luminous Bin Limits (CAT)

Bin ID	Luminous Intensity, I _v (mcd)	
	Min.	Max.
Red		
J5	640	830
J6	700	910
Green		
S2	1600	2080
T2	1700	2210
Blue		
H2	355	462
H3	380	490

Tolerance = ±12%

Bin Information

Example of bin information on reel and packaging label:

CAT : J2 R2 G2 – Red intensity bin J2
 – Green intensity bin R2
 – Blue intensity bin G2
 BIN : GB – Green color bin G
 – Blue color bin B

Color Bin Limits (BIN) – Red

Bin ID	Dominant Wavelength, λ _d (nm)		Chromaticity Coordinates (for Reference)	
	Min.	Max.	x	y

Precautionary Notes

Soldering

- Do not perform reflow soldering more than twice. Observe necessary precautions of handling moisture-sensitive devices as stated in the following section.
- Do not apply any pressure or force on the LED during reflow and after reflow when the LED is still hot.
- Use reflow soldering to solder the LED. Use hand soldering only for rework if unavoidable, but it must be strictly controlled to following conditions:
 - Soldering iron tip temperature = 315°C maximum
 - Soldering duration = 3s maximum
 - Number of cycles = 1 only
 - Power of soldering iron = 50W maximum
- Do not touch the LED package body with the soldering iron except for the soldering terminals, because it may cause damage to the LED.
- Confirm beforehand whether the functionality and performance of the LED is affected by soldering with hand soldering.

Figure 15: Recommended Lead-Free Reflow Soldering Profile

Figure 16: Recommended Board Reflow Direction

Handling Precautions

Special handling precautions must be observed during assembly of epoxy encapsulated LED products. Failure to comply might lead to damage and premature failure of the LED.

- Do not stack assembled PCBs together. Use an appropriate rack to hold the PCBs.
- For automated pick-and-place, Broadcom has tested a nozzle size with OD 3.5 mm to work with this LED. However, due to the possibility of variations in other parameters, such as pick-and-place machine maker/model, and other settings of the machine, verify that the selected nozzle will not cause damage to the LED.

Handling of Moisture-Sensitive Devices

This product has a Moisture Sensitive Level 5a rating per JEDEC J-STD-020. Refer to Broadcom Application Note AN5305, *Handling of Moisture Sensitive Surface Mount Devices* for additional details and a review of proper handling procedures.

- Before use:
 - An unopened moisture barrier bag (MBB) can be stored at <40°C/90% RH for 12 months. If the actual shelf life has exceeded 12 months and the humidity indicator card (HIC) indicates that baking is not required, it is safe to reflow the LEDs per the original MSL rating.
 - Do not open the MBB prior to assembly (for example, for IQC). If unavoidable, the MBB must be properly resealed with fresh desiccant and HIC. The exposed duration must be taken in as floor life.
- Control after opening the MBB:
 - Read the HIC immediately upon opening of MBB.
 - Keep the LEDs at <30°C/60% RH at all times, and complete all high temperature-related processes, including soldering, curing, or rework within 24 hours.
- Control for unfinished reel:

Store unused LEDs in a sealed MBB with desiccant or a desiccator at <5% RH.
- Control of assembled boards:

If the PCB soldered with the LEDs is to be subjected to other high-temperature processes, store the PCB in a sealed MBB with desiccant or desiccator at <5% RH to ensure that all LEDs have not exceeded their floor life of 24 hours.

- Baking is required if:
 - The HIC indicator indicates a change in color for 10% and 5%, as stated on the HIC.
 - The LEDs are exposed to conditions of > 30°C/60% RH at any time.
 - The LED's floor life exceeded 24 hours.

The recommended baking condition is: 65°C ± 5°C for 24 hours.

Baking can only be done once.

- Storage:

The soldering terminals of these Broadcom LEDs are silver plated. If the LEDs are exposed in ambient environments for too long, the silver plating might be oxidized, thus affecting its solderability performance. As such, keep unused LEDs in a sealed MBB with desiccant or in a desiccator at < 5% RH.

Application Precautions

- The drive current of the LED must not exceed the maximum allowable limit across temperature as stated in the data sheet. Constant current driving is recommended to ensure consistent performance.
- Circuit design must cater to the whole range of forward voltage (V_F) of the LEDs to ensure the intended drive current can always be achieved.
- The LED exhibits slightly different characteristics at different drive currents, which may result in a larger variation of performance (meaning: intensity, wavelength, and forward voltage). Set the application current as close as possible to the test current to minimize these variations.
- The LED is not intended for reverse bias. Use other appropriate components for such purposes. When driving the LED in matrix form, ensure that the reverse bias voltage does not exceed the allowable limit of the LED.
- As actual application might not be exactly similar to the test conditions, do verify that the LED will not be damaged by prolonged exposure in the intended environment.
- Avoid rapid changes in ambient temperature, especially in high-humidity environments, because they cause condensation on the LED.
- If the LED is intended to be used in harsh or outdoor environments, protect the LED against damages caused by rain water, water, dust, oil, corrosive gases, external mechanical stresses, and so on.

Thermal Management

The optical, electrical, and reliability characteristics of the LED are affected by temperature. Keep the junction temperature (T_J) of the LED below the allowable limit at all times. T_J can be calculated as follows:

$$T_J = T_A + R_{\theta J-A} \times I_F \times V_{Fmax}$$

where;

T_A = ambient temperature (°C)

$R_{\theta J-A}$ = thermal resistance from LED junction to ambient (°C/W)

I_F = forward current (A)

V_{Fmax} = maximum forward voltage (V)

The complication of using this formula lies in T_A and $R_{\theta J-A}$. Actual T_A is sometimes subjective and hard to determine. $R_{\theta J-A}$ varies from system to system depending on design and is usually not known.

Another way of calculating T_J is by using the solder point temperature, T_S as follows:

$$T_J = T_S + R_{\theta J-S} \times I_F \times V_{Fmax}$$

where;

T_S = LED solder point temperature as shown in the following figure (°C)

$R_{\theta J-S}$ = thermal resistance from junction to solder point (°C/W)

I_F = forward current (A)

V_{Fmax} = maximum forward voltage (V)

Figure 17: Solder Point Temperature on PCB

T_S can be easily measured by mounting a thermocouple on the solder joint as shown in preceding figure, while $R_{\theta J-S}$ is provided in the data sheet. Verify the T_S of the LED in the final product to ensure that the LEDs are operating within all maximum ratings stated in the data sheet.

Eye Safety Precautions

LEDs may pose optical hazards when in operation. Do not look directly at operating LEDs because it might be harmful to the eyes. For safety reasons, use appropriate shielding or personal protective equipment.
