INA210-Q1, **INA211-Q1**, **INA212-Q1**, **INA213-Q1**, **INA214-Q1**, **INA215-Q1**

SBOS475G –MARCH 2009– REVISED MAY 2016

INA21x-Q1 Automotive-Grade, Voltage Output, Low- or High-Side Measurement, Bidirectional, Zero-Drift Series, Current-Shunt Monitors

1 Features

- AEC-Q100 Qualified with:
  - Temperature Grade 1: –40°C to +125°C Ambient Operating Temperature Range
  - Device HBM ESD Classification Level 2
  - Device CDM ESD Classification Level C6
- Wide Common-Mode Range: –0.3 V to 26 V
- Offset Voltage: ±100 µV (Maximum) (Enables Shunt Drops of 10-mV Full-Scale)
- Accuracy:
  - ±1% Gain Error (Maximum Over Temperature)
  - 0.5-µV/°C Offset Drift (Maximum)
  - 10-ppm/°C Gain Drift (Maximum)
- Choice of Gain:
  - INA210-Q1: 200 V/V
  - INA211-Q1: 500 V/V
  - INA212-Q1: 1000 V/V
  - INA213-Q1: 50 V/V
  - INA214-Q1: 100 V/V
  - INA215-Q1: 75 V/V
- Quiescent Current: 100 µA (Maximum)
- SC70 Package

2 Applications

- Body Control Module
- Valve Control
- Motor Control
- Electronic Stability Control
- Wireless Charging Transmitters

3 Description

The INA21x-Q1 family of devices is a voltage-output, current-shunt monitor (also called a current-sense amplifier) that can sense drops across shunts at common-mode voltages from –0.3 V to 26 V, independent of the supply voltage. Five fixed gains are available: 50 V/V, 75 V/V, 100 V/V, 200 V/V, 500 V/V, and 1000 V/V. This family of devices is commonly used for overcurrent detection, voltage feedback control loops, or as a power monitor. The low offset of the zero-drift architecture enables current sensing with maximum drops across the shunt as low as 10-mV full-scale.

The devices operate from a single 2.7-V to 26-V power supply, drawing a maximum of 100 µA of supply current. The devices are specified over the operating temperature range of –40°C to 125°C and are offered in a 6-pin SC70 package.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA210-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA211-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA212-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA213-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA214-Q1	SC70 (6)	2.00 mm × 1.25 mm
INA215-Q1	SC70 (6)	2.00 mm × 1.25 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Simplified Schematic

PRODUCT	GAIN	R_3 and R_4	R_1 and R_2
INA210-Q1	200	5 kΩ	1 MΩ
INA211-Q1	500	2 kΩ	1 MΩ
INA212-Q1	1000	1 kΩ	1 MΩ
INA213-Q1	50	20 kΩ	1 MΩ
INA214-Q1	100	10 kΩ	1 MΩ
INA215-Q1	75	13.3 kΩ	1 MΩ
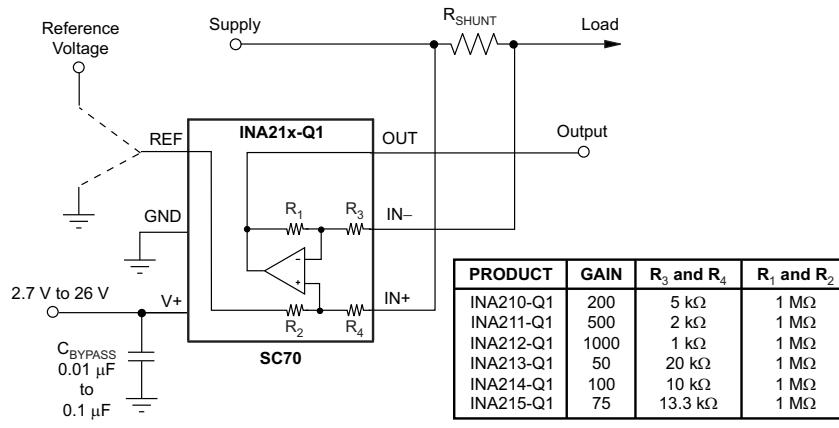

$$V_{OUT} = (I_{LOAD} \times R_{SHUNT})\ Gain + V_{REF}$$

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (April 2016) to Revision G	**Page**
• Released INA210-Q1, INA211-Q1, and INA215-Q1 to production 1	
• Deleted second footnote from *Device Information* table 1	
• Deleted footnote from *Device Options* table 4	

Changes from Revision E (December 2014) to Revision F	**Page**
• Changed first Features bullet 1	
• Changed *Choice of Gain* Features bullet: added INA210-Q1, INA211-Q1, and INA215-Q1 sub-bullets, deleted A from INA213-Q1... 1	
• Changed first paragraph of Description section 1	
• Changed *Device Information* table: added INA210-Q1, INA211-Q1, INA215-Q1 rows, deleted A from INA213A-Q1, changed package term from SOT to SC70 1	
• Changed Simplified Schematic: changed figure table.. 1	
• Added *Device Options* table 4	
• Deleted footnote 1 from *Pin Functions* table 4	
• Changed *Absolute Maximum Ratings* table: changed operating temperature from –55°C to 150°C to –40°C to 125°C 5	
• Changed Changed *ESD Ratings* table: changed title, made CDM values all one row because corner pins and all other pins tested the same, added separation of specs for versions A and B, and moved the storage temperature to *Absolute Maximum Ratings* table; added version B devices 5	
• Changed *Electrical Characteristics* table: changed conditions and changed all INA213A-Q1 to INA213-Q1 6	
• Changed Input, V_{CM} parameter in *Electrical Characteristics* table 6	
• Changed Input, *CMRR* and V_{OS} parameters in *Electrical Characteristics* table 6	
• Changed Output, *Gain* parameter in *Electrical Characteristics* table 6	
• Deleted test conditions from Output, *Nonlinearity error* parameter in *Electrical Characteristics* table 6	
• Changed Frequency Response, *BW* parameter in *Electrical Characteristics* table 7	
• Changed conditions of *Typical Characteristics* section 8

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply voltage, V_S			26	V
Analog inputs, V_{IN+} , V_{IN-}[2]	Differential $(V_{IN+}) - (V_{IN-})$	−26	26	V
	Common-mode	GND − 0.3	26	
REF input		GND − 0.3	$(V_S) + 0.3$	V
Output[3]		GND − 0.3	$(V_S) + 0.3$	V
Input current into any pin[3]			5	mA
Operating temperature		−40	125	°C
Junction temperature			150	°C
Storage temperature, T_{stg}		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) V_{IN+} and V_{IN-} are the voltages at the IN+ and IN− pins, respectively.
(3) Input voltage at any pin can exceed the voltage shown if the current at that pin is limited to 5 mA.

7.2 ESD Ratings

			MAX	UNIT
INA21x-Q1, Version A				
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002[1]	±2000	V
		Charged device model (CDM), per AEC Q100-011	±1000	
INA21x-Q1, Version B				
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002[1]	±3500	V
		Charged device model (CDM), per AEC Q100-011	±1000	

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CM}	Common-mode input voltage		12		V
V_S	Supply voltage	2.7		26	V
T_J	Junction temperature	−40		125	°C

7.4 Thermal Information

		INA21x-Q1	UNIT
	THERMAL METRIC[1]	DCK (SC70)	
		6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	227.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	79.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	72.1	°C/W
ψ_{JT}	Junction-to-top characterization parameter	3.6	°C/W
ψ_{JB}	Junction-to-board characterization parameter	70.4	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

7.5 Electrical Characteristics

At T_A = 25°C, V_{SENSE} = V_{IN+} − V_{IN-}.
INA210-Q1, INA213-Q1, INA214-Q1, and INA215-Q1: V_S = 5 V, V_{IN+} = 12 V, and V_{REF} = V_S / 2, unless otherwise noted.
INA211-Q1 and INA212-Q1: V_S = 12 V, V_{IN+} = 12 V, and V_{REF} = V_S / 2, unless otherwise noted.

PARAMETER		TEST CONDITIONS		T_A[1]	MIN	TYP	MAX	UNIT
INPUT								
V_{CM}	Common-mode input	Version A		Full range	−0.3		26	V
		Version B			−0.1		26	
CMRR	Common-mode rejection ratio	V_{IN+} = 0 V to 26 V, V_{SENSE} = 0 mV, T_A = −40°C to 125°C	INA210-Q1, INA211-Q1, INA212-Q1, INA214-Q1, INA215-Q1	Full range	105	140		dB
			INA213-Q1		100	120		
V_{OS}	Offset voltage, RTI[2]	V_{SENSE} = 0 mV	INA210-Q1, INA211-Q1, INA212-Q1	25°C		±0.55	±35	µV
			INA213-Q1			±5	±100	
			INA214-Q1, INA215-Q1			±1	±60	
dV_{OS}/dT	Offset voltage vs temperature[3]			Full range		0.1	0.5	µV/°C
PSR	Offset voltage vs power supply	V_S = 2.7 V to 18 V, V_{IN+} = 18 V, V_{SENSE} = 0 mV		25°C		±0.1	±10	µV/V
I_B	Input bias current	V_{SENSE} = 0 mV		25°C	15	28	35	µA
I_{OS}	Input offset current	V_{SENSE} = 0 mV		25°C		±0.02		µA
OUTPUT								
Gain		INA210-Q1				200		V/V
		INA211-Q1				500		
		INA212-Q1				1000		
		INA213-Q1				50		
		INA214-Q1				100		
		INA215-Q1				75		
	Gain error	V_{SENSE} = −5 mV to 5 mV		Full range		±0.02%	±1%	
	Gain error vs temperature[3]			Full range		3	10	ppm/°C
	Nonlinearity error			25°C		±0.01%		
	Maximum capacitive load	No sustained oscillation		25°C		1		nF
VOLTAGE OUTPUT								
	Output voltage swing to V+ power-supply rail[4]	R_L = 10 kΩ to GND		Full range		(V+) − 0.05	(V+) − 0.2	V
	Output voltage swing to GND			Full range		(V_{GND}) + 0.005	(V_{GND}) + 0.05	V

(1) Full range T_A = −40°C to 125°C.
(2) RTI = referred to input.
(3) Not production tested.
(4) See Figure 10, *Output Voltage Swing vs Output Current*, in the *Typical Characteristics* section.

8 Detailed Description

8.1 Overview

The INA210-Q1 to INA215-Q1 are 26-V, common-mode, zero-drift topology, current-sensing amplifiers that can be used in both low-side and high-side configurations. These specially-designed, current-sensing amplifiers are able to accurately measure voltages developed across current-sensing resistors on common-mode voltages that far exceed the supply voltage powering the device. Current can be measured on input voltage rails as high as 26 V and the device can be powered from supply voltages as low as 2.7 V.

The zero-drift topology enables high-precision measurements with maximum input offset voltages as low as 35 µV with a maximum temperature contribution of 0.5 µV/°C over the full temperature range of –40°C to 125°C.

8.2 Functional Block Diagram
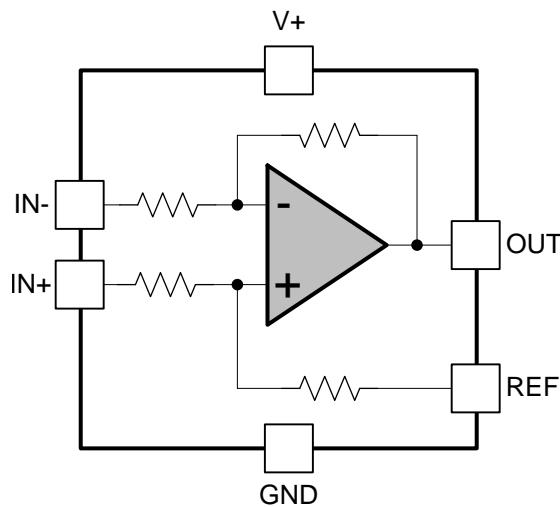

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Basic Connections

Figure 23 shows the basic connections of the INA210-Q1 to INA215-Q1. Connect the input pins (IN+ and IN−) as closely as possible to the shunt resistor to minimize any resistance in series with the shunt resistor.
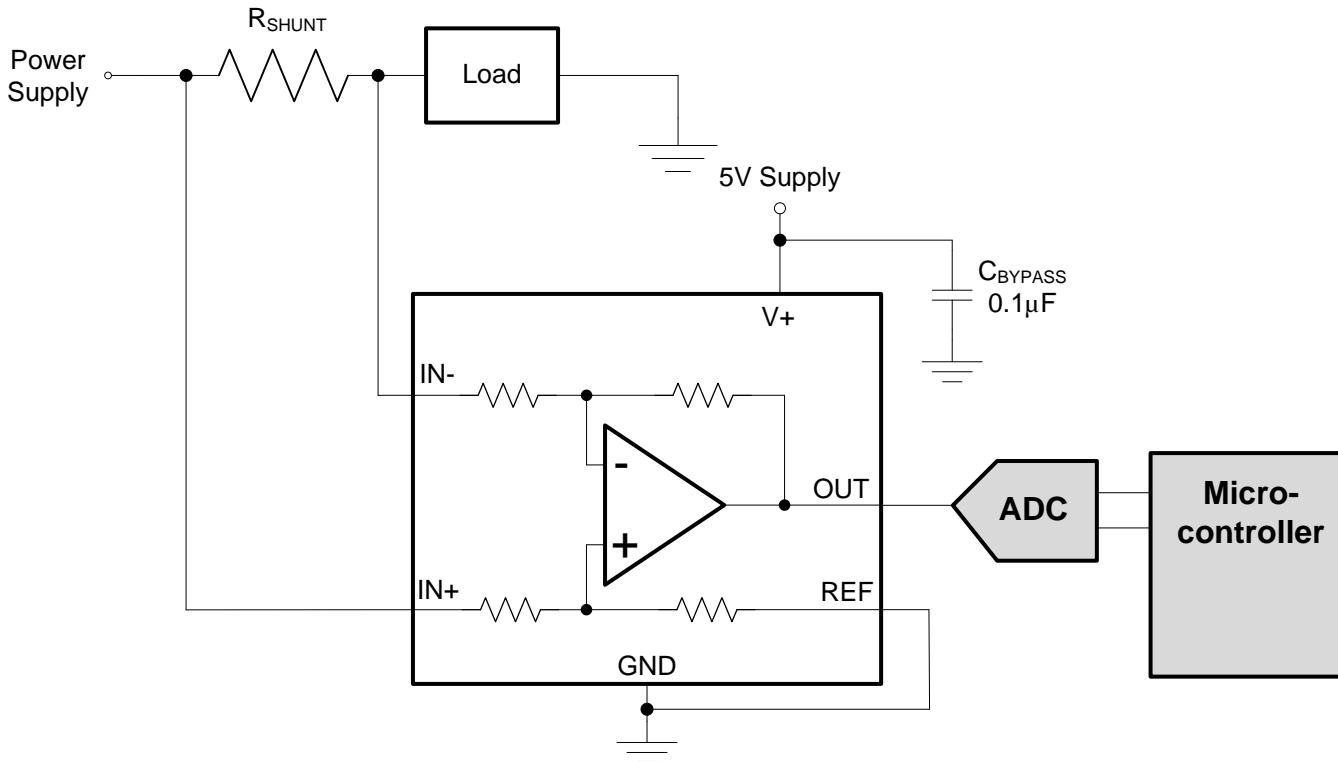

Figure 23. Typical Application

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies can require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

8.3.2 Selecting R_S

The zero-drift offset performance of the INA21x-Q1 family of devices offers several benefits. In general, the primary advantage of the low offset characteristic enables lower full-scale drops across the shunt. For example, non-zero-drift current-shunt monitors typically require a full-scale range of 100 mV.

The INA21x-Q1 family of devices provides equivalent accuracy at a full-scale range on the order of 10 mV. This accuracy reduces shunt dissipation by an order of magnitude with many additional benefits.

Alternatively, some applications must measure current over a wide dynamic range and can take advantage of the low offset on the low end of the measurement. Most often, these applications can use the lower-gain INA213-Q1, INA214-Q1, or INA215-Q1 to accommodate larger shunt drops on the upper end of the scale. For instance, an INA213-Q1 device operating on a 3.3-V supply can easily support a full-scale shunt drop of 60 mV, with only 100 µV of offset.

8.4 Device Functional Modes

8.4.1 Input Filtering

An obvious and straightforward location for filtering is at the output of the INA21x-Q1 family of devices. However, this location negates the advantage of the low output impedance of the internal buffer. The only other filtering option is at the input pins of the INA21x-Q1 family of devices. This location, however, requires consideration of the ±30% tolerance of the internal resistances. Figure 24 shows a filter placed at the input pins.
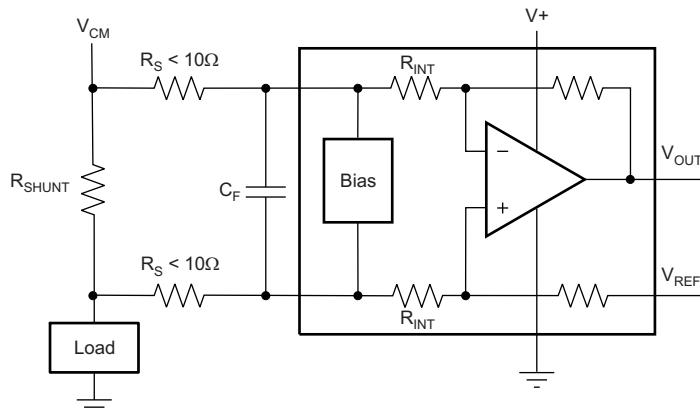

Figure 24. Filter at Input Pins

The addition of external series resistance, however, creates an additional error in the measurement so the value of these series resistors must be kept to 10 Ω (or less, if possible) to reduce impact to accuracy. The internal bias network shown in Figure 24 that is present at the input pins creates a mismatch in input bias currents when a differential voltage is applied between the input pins. If additional external series filter resistors are added to the circuit, the mismatch in bias currents results in a mismatch of voltage drops across the filter resistors. This mismatch creates a differential error voltage that subtracts from the voltage developed at the shunt resistor. This error results in a voltage at the device input pins that is different than the voltage developed across the shunt resistor. Without the additional series resistance, the mismatch in input bias currents has little effect on device operation. The amount of error these external filter resistors add to the measurement can be calculated using Equation 2 where the gain error factor is calculated using Equation 1.

The amount of variance in the differential voltage present at the device input relative to the voltage developed at the shunt resistor is based both on the external series resistance value as well as the internal input resistors, R_3 and R_4 (or R_{INT} as shown in Figure 24). The reduction of the shunt voltage reaching the device input pins appears as a gain error when comparing the output voltage relative to the voltage across the shunt resistor. A factor can be calculated to determine the amount of gain error that is introduced by the addition of external series resistance. Use Equation 1 to calculate the expected deviation from the shunt voltage to what is measured at the device input pins.

$$\text{Gain Error Factor} = \frac{(1250 \times R_{INT})}{(1250 \times R_S) + (1250 \times R_{INT}) + (R_S \times R_{INT})}$$

where:

- R_{INT} is the internal input resistor (R_3 and R_4), and
- R_S is the external series resistance. (1)

Device Functional Modes (continued)

With the adjustment factor from Equation 1 including the device internal input resistance, this factor varies with each gain version, as shown in Table 1. Table 2 lists each individual device gain-error factor.

Table 1. Input Resistance

PRODUCT	GAIN	R_{INT} (kΩ)
INA210-Q1	200	5
INA211-Q1	500	2
INA212-Q1	1000	1
INA213-Q1	50	20
INA214-Q1	100	10
INA215-Q1	75	13.3

Table 2. Device Gain Error Factor

PRODUCT	SIMPLIFIED GAIN ERROR FACTOR
INA210-Q1	$\dfrac{1000}{R_S + 1000}$
INA211-Q1	$\dfrac{10{,}000}{(13 \times R_S) + 10{,}000}$
INA212-Q1	$\dfrac{5000}{(9 \times R_S) + 5000}$
INA213-Q1	$\dfrac{20{,}000}{(17 \times R_S) + 20{,}000}$
INA214-Q1	$\dfrac{10{,}000}{(9 \times R_S) + 10{,}000}$
INA215-Q1	$\dfrac{8{,}000}{(7 \times R_S) + 8{,}000}$

Use Equation 2 to calculate the gain error that can be expected from the addition of the external series resistors.

$$\text{Gain Error (\%)} = 100 - (100 \times \text{Gain Error Factor})$$

(2)

For example, using an INA212-Q1 device and the corresponding gain error equation from Table 2, a series resistance of 10 Ω results in a gain error factor of 0.982. The corresponding gain error is then calculated using Equation 2, resulting in a gain error of approximately 1.77% solely because of the external 10-Ω series resistors. Using an INA213-Q1 with the same 10-Ω series resistor results in a gain error factor of 0.991 and a gain error of 0.84% again solely because of these external resistors.

8.4.2 Shutting Down the INA21x-Q1 Series

While the INA21x-Q1 family of devices does not have a shutdown pin, the low-power consumption of the device allows the output of a logic gate or transistor switch to power the device. This gate or switch turns on and turns off the INA21x-Q1 power-supply quiescent current.

However, in current-shunt monitoring applications, the amount of current drained from the shunt circuit in shutdown conditions must be considered. Evaluating this current drain involves considering the simplified schematic of the INA21x-Q1 family of devices in shutdown mode shown in Figure 25.

PRODUCT	R_3 and R_4
INA210-Q1	5 kΩ
INA211-Q1	2 kΩ
INA212-Q1	1 kΩ
INA213-Q1	20 kΩ
INA214-Q1	10 kΩ
INA215-Q1	13.3 kΩ
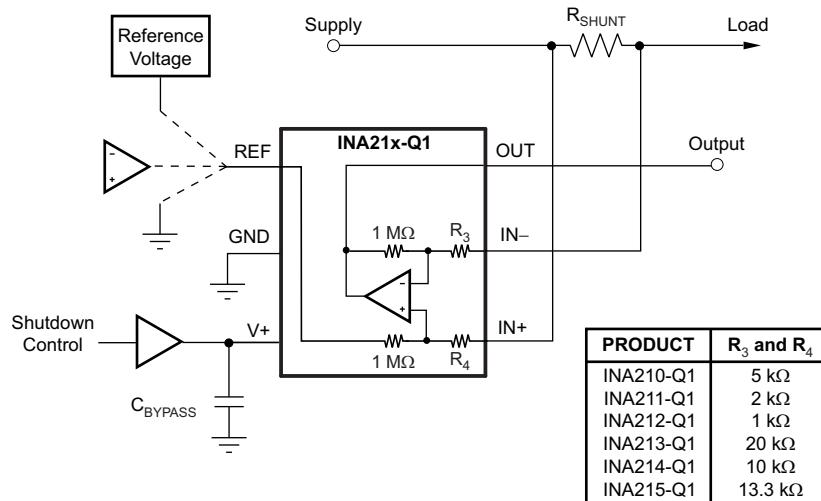

NOTE: 1-MΩ paths from shunt inputs to reference and INA21x-Q1 outputs.

Figure 25. Basic Circuit for Shutting Down INA21x-Q1 With a Grounded Reference

Slightly more than a 1-MΩ impedance (from the combination of 1-MΩ feedback and 5-kΩ input resistors) exists from each input of the INA21x-Q1 family of devices to the OUT pin and to the REF pin. The amount of current flowing through these pins depends on the respective ultimate connection. For example, if the REF pin is grounded, the calculation of the effect of the 1-MΩ impedance from the shunt to ground is straightforward. However, if the reference or operational amplifier (op amp) is powered when the INA21x-Q1 family of devices is shut down, the calculation is direct. Instead of assuming 1 MΩ to ground, however, assume 1 MΩ to the reference voltage. If the reference or op amp is also shut down, some knowledge of the reference or op amp output impedance under shutdown conditions is required. For instance, if the reference source behaves as an open circuit when not powered, little or no current flows through the 1-MΩ path.

Regarding the 1-MΩ path to the output pin, the output stage of a disabled INA21x-Q1 device does constitute a good path to ground; consequently, this current is directly proportional to a shunt common-mode voltage present across a 1-MΩ resistor.

NOTE

When the device is powered up, an additional, nearly constant and well-matched 25-µA current flows in each of the inputs as long as the shunt common-mode voltage is 3 V or higher. Below 2-V common-mode, the only current effects are the result of the 1-MΩ resistors.

8.4.3 REF Input Impedance Effects

As with any difference amplifier, the INA21x-Q1 common-mode rejection ratio is affected by any impedance present at the REF input. This concern is not a problem when the REF pin is connected directly to most references or power supplies. When using resistive dividers from the power supply or a reference voltage, buffer the REF pin by an op amp.

In systems where the INA21x-Q1 output can be sensed differentially, such as by a differential input analog-to-digital converter (ADC) or by using two separate ADC inputs, the effects of external impedance on the REF input can be cancelled. Figure 26 shows a method of taking the output from the INA21x-Q1 family of devices by using the REF pin as a reference.
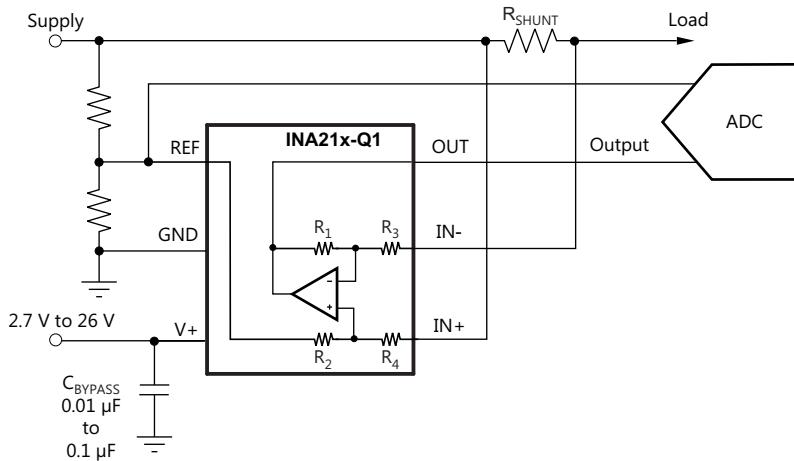

Figure 26. Sensing INA21x-Q1 to Cancel Effects of Impedance on the REF Input

8.4.4   Using the INA21x-Q1 with Common-Mode Transients Above 26 V

With a small amount of additional circuitry, the INA21x-Q1 family of devices can be used in circuits subject to transients higher than 26 V, such as automotive applications. Use only Zener diode or Zener-type transient absorbers (sometimes referred to as *transzorbs*)—any other type of transient absorber has an unacceptable time delay. Begin by adding a pair of resistors as a working impedance for the Zener diode, as shown in Figure 27. Keeping these resistors as small as possible is preferable, typically around 10 Ω. Larger values can be used with an effect on gain that is discussed in the *Input Filtering* section. Because this circuit limits only short-term transients, many applications are satisfied with a 10-Ω resistor along with conventional Zener diodes of the lowest power rating that can be found. This combination uses the least amount of board space. These diodes can be found in packages as small as SOT-523 or SOD-523.
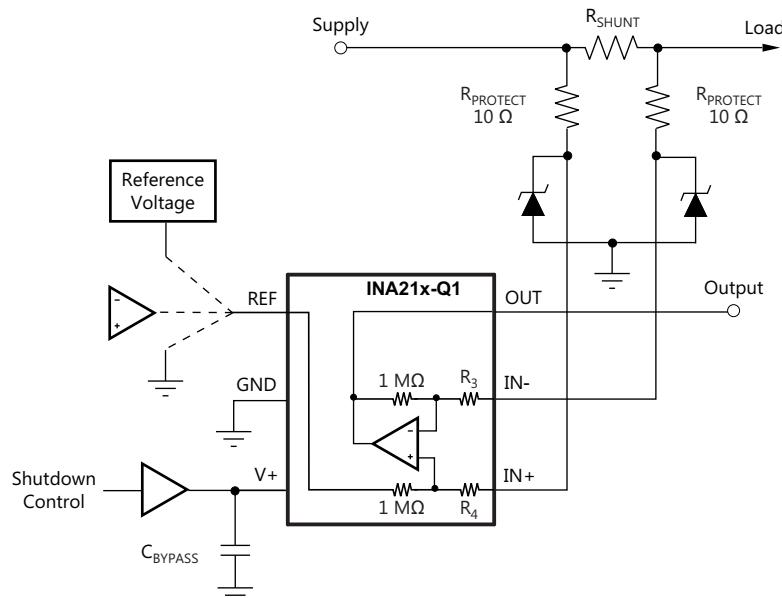

Figure 27. INA21x-Q1 Transient Protection Using Dual Zener Diodes

In the event that low-power Zener diodes do not have sufficient transient absorption capability and a higher power transzorb must be used, the most package-efficient solution then involves using a single transzorb and back-to-back diodes between the device inputs. The most space-efficient solutions are dual series-connected diodes in a single SOT-523 or SOD-523 package. Figure 28 shows this method. In either of these examples, the total board area required by the INA21x-Q1 family of devices with all protective components is less than that of an SO-8 package, and only slightly greater than that of an MSOP-8 package.

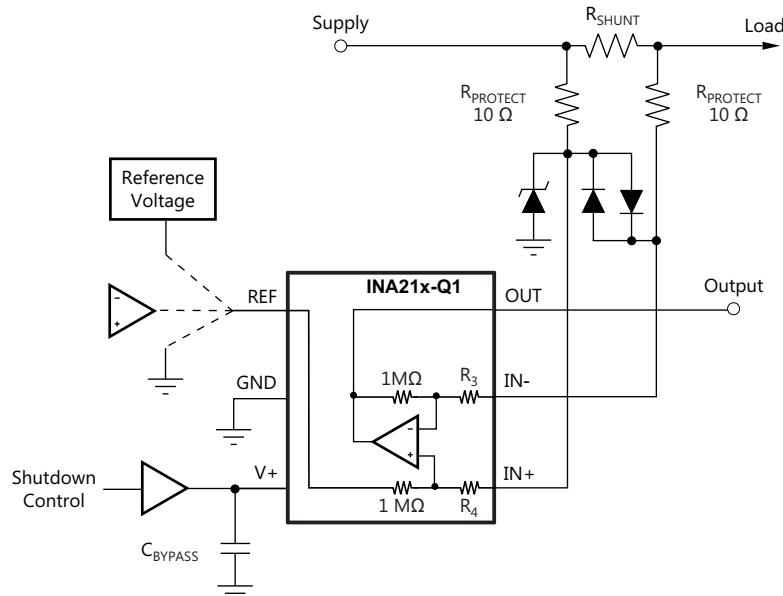

Figure 28. INA21x-Q1 Transient Protection Using a Single Transzorb and Input Clamps

8.4.5 Improving Transient Robustness

CAUTION

Applications involving large input transients with excessive dV/dt above 2 kV per microsecond present at the device input pins can cause damage to the internal ESD structures on version A devices.

The potential damage from large input transients is a result of the internal latching of the ESD structure to ground when this transient occurs at the input. With significant current available in most current-sensing applications, the large current flowing through the input transient-triggered, ground-shorted ESD structure quickly results in damage to the silicon. External filtering can be used to attenuate the transient signal prior to reaching the inputs to avoid the latching condition. Care must be taken to ensure that external series input resistance does not significantly impact gain error accuracy. For accuracy purposes, keep these resistances under 10 Ω if possible. Ferrite beads are recommended for this filter because of the inherently low-dc ohmic value. Ferrite beads with less than 10 Ω of resistance at dc and over 600 Ω of resistance at 100 MHz to 200 MHz are recommended. The recommended capacitor values for this filter are between 0.01 µF and 0.1 µF to ensure adequate attenuation in the high-frequency region. Figure 29 illustrates this protection scheme.

Product Folder Links: *INA210-Q1 INA211-Q1 INA212-Q1 INA213-Q1 INA214-Q1 INA215-Q1*
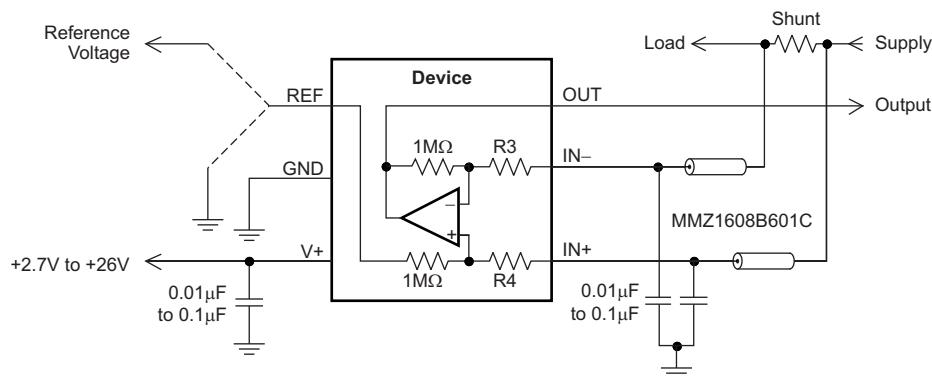

Figure 29. Transient Protection

To minimize the cost of adding these external components to protect the device in applications where large transient signals may be present, version B devices are now available with new ESD structures that are not susceptible to this latching condition. Version B devices are incapable of sustaining these damage-causing latched conditions so they do not have the same sensitivity to the transients that the version A devices have, thus making the version B devices a better fit for these applications.

9   Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1   Application Information

The INA21x-Q1 family of devices measure the voltage developed across a current-sensing resistor when current passes through the resistor. The ability to drive the reference pin to adjust the functionality of the output signal offers multiple configurations, as discussed throughout the *Typical Applications* section.

9.2 Typical Applications

9.2.1 Unidirectional Operation

Unidirectional operation allows the INA21x-Q1 family of devices to measure currents through a resistive shunt in one direction. The most frequent case of unidirectional operation sets the output at ground by connecting the REF pin to ground. In unidirectional applications where the highest possible accuracy is desirable at very low inputs, bias the REF pin to a convenient value above 50 mV to get the device output swing into the linear range for zero inputs.

A less frequent case of unipolar output biasing is to bias the output by connecting the REF pin to the supply. In this case, the quiescent output for zero input is at quiescent supply. This configuration only responds to negative currents (inverted voltage polarity at the device input).
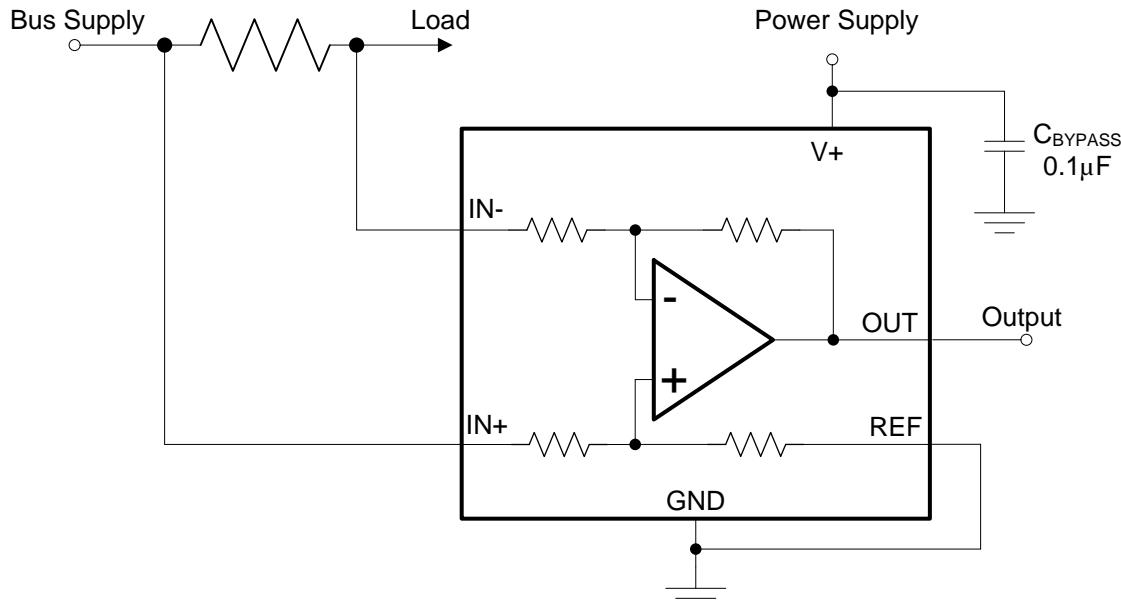

Copyright © 2016, Texas Instruments Incorporated

Figure 30. Unidirectional Application Schematic

9.2.1.1 Design Requirements

The device can be configured to monitor current flowing in one direction (unidirectional) or in both directions (bidirectional) depending on how the REF pin is configured. The most common case is unidirectional where the output is set to ground when no current is flowing by connecting the REF pin to ground, as shown in Figure 30. When the input signal increases, the output voltage at the OUT pin increases.

9.2.1.2 Detailed Design Procedure

The linear range of the output stage is limited in how close the output voltage can approach ground under zero input conditions. In unidirectional applications where measuring very-low input currents is desirable, bias the REF pin to a convenient value above 50 mV to get the output into the linear range of the device. To limit common-mode rejection errors, TI recommends buffering the reference voltage connected to the REF pin.

A less frequently-used output biasing method is to connect the REF pin to the supply voltage, V+. This method results in the output voltage saturating at 200 mV below the supply voltage when no differential input signal is present. This method is similar to the output-saturated low condition with no input signal when the REF pin is connected to ground. The output voltage in this configuration only responds to negative currents that develop negative differential input voltage relative to the device IN– pin. Under these conditions, when the differential input signal increases negatively, the output voltage moves downward from the saturated supply voltage. The voltage applied to the REF pin must not exceed the device supply voltage.

Typical Applications (continued)

9.2.1.3 Application Curve

Figure 31 shows an example output response of a unidirectional configuration. With the REF pin connected directly to ground, the output voltage is biased to this zero output level. The output rises above the reference voltage for positive differential input signals but cannot fall below the reference voltage for negative differential input signals because of the grounded reference voltage.

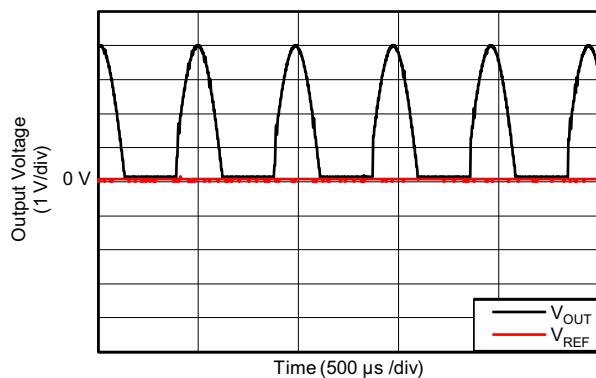

Figure 31. Unidirectional Application Output Response

Typical Applications (continued)

9.2.2 Bidirectional Operation
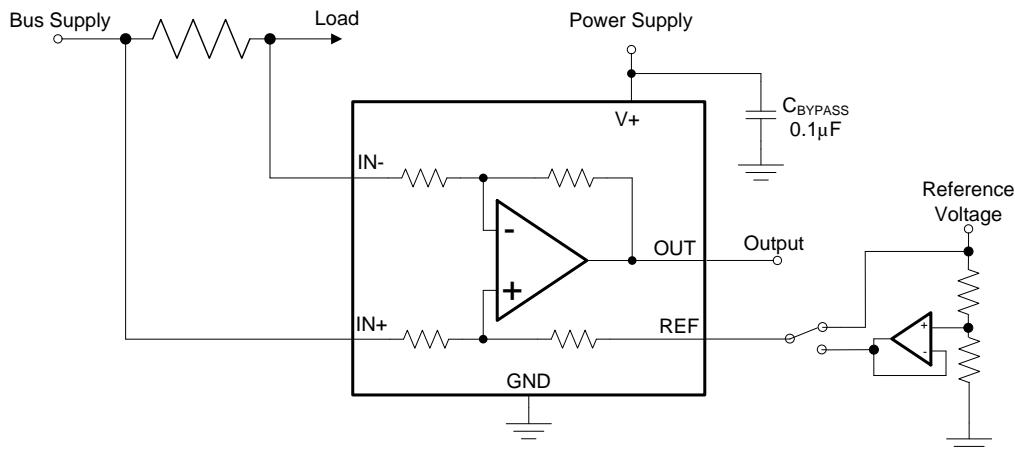

Copyright © 2016, Texas Instruments Incorporated

Figure 32. Bidirectional Application Schematic

9.2.2.1 Design Requirements

The device is a bidirectional, current-sense amplifier capable of measuring currents through a resistive shunt in two directions. This bidirectional monitoring is common in applications that include charging and discharging operations where the current flow-through resistor can change directions.

9.2.2.2 Detailed Design Procedure

The ability to measure this current flowing in both directions is enabled by applying a voltage to the REF pin, as shown in Figure 32. The voltage applied to REF (V_{REF}) sets the output state that corresponds to the zero-input level state. The output then responds by increasing above the V_{REF} value for positive differential signals (relative to the IN– pin) and responds by decreasing below the V_{REF} value for negative differential signals. This reference voltage applied to the REF pin can be set anywhere between 0 V to V+. For bidirectional applications, the V_{REF} value is typically set at mid-scale for equal signal range in both current directions. In some cases, however, the V_{REF} value is set at a voltage other than mid-scale when the bidirectional current and corresponding output signal are note required to be symmetrical.

9.2.2.3 Application Curve

Figure 33 shows an example output response of a bidirectional configuration. With the REF pin connected to a reference voltage, 2.5 V in this case, the output voltage is biased upwards by this reference level. The output rises above the reference voltage for positive differential input signals and falls below the reference voltage for negative differential input signals.
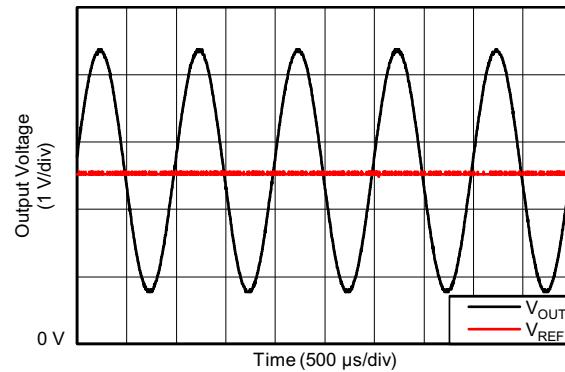

Figure 33. Bidirectional Application Output Response

10 Power Supply Recommendations

The input circuitry of the INA21x-Q1 family of devices can accurately measure beyond the power-supply voltage, V+. For example, the V+ power supply can be 5 V, whereas the load power-supply voltage can be as high as 26 V. However, the output voltage range of the OUT pin is limited by the voltages on the power-supply pin. The INA21x-Q1 family of devices can withstand the full input-signal range up to 26 V at the input pins, regardless of whether the device has power applied or not.

11 Layout

11.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very-low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as closely as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 µF. Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

11.2 Layout Example
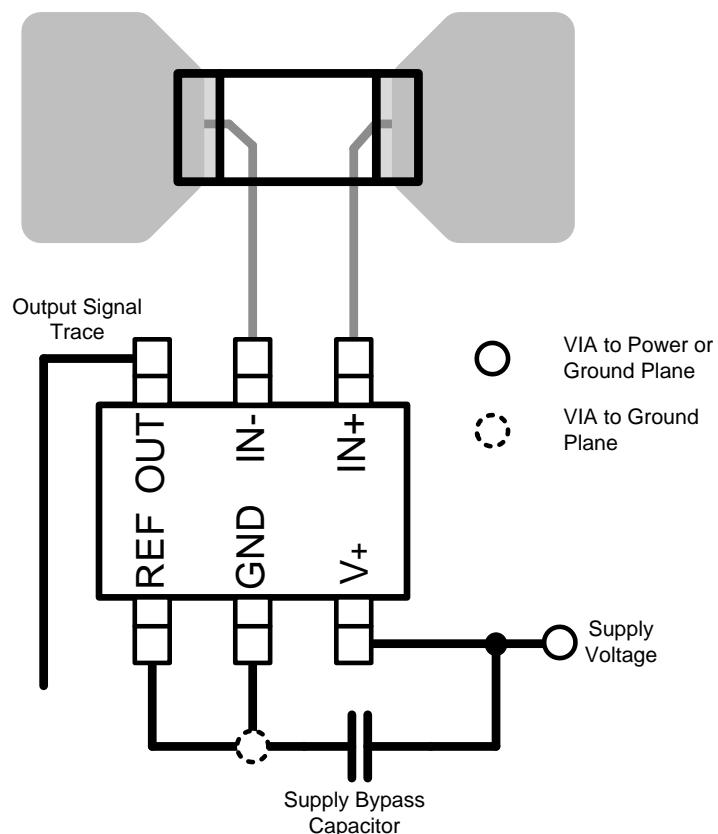

Figure 34. Recommended Layout

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
