

## LM3704 Voltage Supervisor With Power-Fail Input, Low-Line Output and Manual Reset

### 1 Features

- Available Threshold Voltage of 3.08 V and 2.32 V
- No External Components Required
- Manual-Reset Input
- Available in Both Open-Drain and Push-Pull Configuration
- Reset Time-Out Delay of 200 ms
- Separate Power-Fail Comparator
- $\pm 0.5\%$  Reset Threshold Accuracy at Room Temperature
- $\pm 2\%$  Reset Threshold Accuracy Over Temperature
- $28\text{-}\mu\text{A}$   $V_{CC}$  Supply Current

### 2 Applications

- Embedded Controllers and Processors
- Intelligent Instruments
- Automotive Systems
- Critical  $\mu\text{P}$  Power Monitoring

### 3 Description

The LM3704 is a feature-rich, easy-to-use voltage supervisor. It is offered in both push-pull and open-drain configuration with a tight 2% accuracy over temperature.

The LM3704 features include a manual reset, low-line output, and power-fail input detection. The power-fail input allows for a configurable second rail to be monitored helping detect upstream failures. The low-line output is used as a second interrupt line to indicate a fall in  $V_{CC}$  ( $1.02 \times VRST$ ).

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM3704	VSSOP (10)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

**Pin Functions**

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V <sub>CC</sub>	I	Power supply input.
2	$\overline{\text{MR}}$	I	Manual-reset input. When $\overline{\text{MR}}$ is less than V <sub>MRT</sub> (manual reset threshold) $\overline{\text{RESET}}/\text{RESET}$ is engaged.
3	PFI	I	Power-fail comparator input. When PFI is less than V <sub>PFT</sub> (power-fail reset threshold), the $\overline{\text{PFO}}$ goes low. Otherwise, $\overline{\text{PFO}}$ remains high.
4	NC	—	No connection.
5	GND	—	Ground reference for all signals.
6	NC	—	No connection.
7	$\overline{\text{LLO}}$	O	Low-line logic output. Early power-fail warning output. Low when V <sub>CC</sub> falls below V <sub>LLOT</sub> (low-line output threshold). This output can be used to generate an NMI (non-maskable interrupt) to provide an early warning of imminent power failure.
8	$\overline{\text{PFO}}$	O	Power-fail logic output. When PFI is below V <sub>PFT</sub> , $\overline{\text{PFO}}$ goes low; otherwise, $\overline{\text{PFO}}$ remains high.
9	NC	—	No connection. Test input used at factory only. Leave floating.
10	$\overline{\text{RESET}}$	O	Reset logic output. Pulses low for t <sub>RP</sub> (reset time-out period) when triggered, and stays low whenever V <sub>CC</sub> is below the reset threshold or when $\overline{\text{MR}}$ is below V <sub>MRT</sub> . It remains low for t <sub>RP</sub> after either V <sub>CC</sub> rises above the reset threshold, or after $\overline{\text{MR}}$ input rises above V <sub>MRT</sub> .

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Supply voltage, $V_{CC}$	-0.3	6	V
All other inputs	-0.3	$V_{CC} + 0.3$	V
Power dissipation	See <sup>(2)</sup>		
Storage temperature, $T_{stg}$	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The maximum allowable power dissipation is a function of the maximum junction temperature,  $T_J(\text{MAX})$ , the junction-to-ambient thermal resistance,  $\theta_{J-A}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation at any ambient temperature is calculated using:

$$P(\text{MAX}) = \frac{T_J(\text{MAX}) - T_A}{\theta_{J-A}}$$

Where the value of  $\theta_{J-A}$  for the 10-pin VSSOP package is 195°C/W in a typical printed-circuit board (PCB) mounting and the DSBGA package is 220°C/W.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{\text{ESD}}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±150	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
$T_A$ Free-air temperature	-40	85	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LM3704	UNIT
		DGS (VSSOP)	
		10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	163.7	°C/W
$R_{\theta JC(\text{top})}$	Junction-to-case (top) thermal resistance	58.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	83.5	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	6	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	82.2	°C/W
$R_{\theta JC(\text{bot})}$	Junction-to-case (bottom) thermal resistance	—	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

at  $T_J = 25^\circ\text{C}$  and  $V_{CC} = 2.2\text{ V to }5.5\text{ V}$  (unless otherwise noted)

## 7 Detailed Description

### 7.1 Overview

The LM3704 microprocessor supervisory circuit monitors power supplies and battery-controlled functions in systems and does not require external components. There is a standard reset threshold voltage of 3.08 V while other custom reset threshold voltages are available to provide maximum monitoring flexibility. The  $\overline{\text{RESET}}$  pin pulses low for the reset time-out period when triggered and stays low whenever  $V_{\text{CC}}$  is below the reset threshold or when  $\overline{\text{MR}}$  is below  $V_{\text{MRT}}$ . Once the  $V_{\text{CC}}$  rises above the reset threshold, or after  $\overline{\text{MR}}$  input rises above  $V_{\text{MRT}}$ , the  $\overline{\text{RESET}}$  pin remains low for the reset timeout period before coming up.

### 7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 7.3 Feature Description

#### 7.3.1 Reset Output

The reset input of a  $\mu\text{P}$  initializes the device into a known state. The LM3704 microprocessor supervisory circuit asserts a forced reset output to prevent code execution errors during power-up, power-down, and brownout conditions.

$\overline{\text{RESET}}$  is ensured valid for  $V_{\text{CC}} > 1 \text{ V}$ . Once  $V_{\text{CC}}$  exceeds the reset threshold, an internal timer maintains the output for the reset time-out period. After this interval, reset goes high. The LM3704 offers an active-low  $\overline{\text{RESET}}$ .

Any time  $V_{\text{CC}}$  drops below the reset threshold (such as during a brownout), the reset activates. When  $V_{\text{CC}}$  again rises above the reset threshold, the internal timer starts. Reset holds until  $V_{\text{CC}}$  exceeds the reset threshold for longer than the reset time-out period. After this time, reset releases.

## Feature Description (continued)

The Manual Reset input ( $\overline{\text{MR}}$ ) initiates a forced reset also. See [Manual Reset Input \( \$\overline{\text{MR}}\$ \)](#).

### 7.3.2 Reset Threshold

The LM3704 is available with a reset voltage of 3.08 V. Other reset thresholds in the 2.20-V to 5-V range, in steps of 10 mV, are available; contact Texas Instruments for details.

### 7.3.3 Manual Reset Input ( $\overline{\text{MR}}$ )

Many  $\mu\text{P}$ -based products require a manual reset capability, allowing the operator to initiate a reset. The  $\overline{\text{MR}}$  input is fully debounced and provides an internal 56-k $\Omega$  pullup. When the  $\overline{\text{MR}}$  input is pulled below  $V_{\text{MRT}}$  (1.225 V) for more than 25  $\mu\text{s}$ , reset is asserted after a typical delay of 12  $\mu\text{s}$ . Reset remains active as long as  $\overline{\text{MR}}$  is held low, and releases after the reset time-out period expires after  $\overline{\text{MR}}$  rises above  $V_{\text{MRT}}$ . Use  $\overline{\text{MR}}$  with digital logic to assert or to daisy chain supervisory circuits. It may be used as another low-line comparator by adding a buffer.

### 7.3.4 Power-Fail Comparator (PFI/ $\overline{\text{PFO}}$ )

The PFI is compared to a 1.225-V internal reference,  $V_{\text{PFT}}$ . If PFI is less than  $V_{\text{PFT}}$ , the Power-Fail Output ( $\overline{\text{PFO}}$ ) drops low. The power-fail comparator signals a falling power supply, and is driven typically by an external voltage divider that senses either the unregulated supply or another system supply voltage. The voltage divider generally is chosen so the voltage at PFI drops below  $V_{\text{PFT}}$  several milliseconds before the main supply voltage drops below the reset threshold, providing advanced warning of a brownout.

The voltage threshold is set by  $R_1$  and  $R_2$  and is calculated with [Equation 1](#).

$$V_{\text{PFT}} = \left( \frac{R_1 + R_2}{R_2} \right) \times 1.225\text{V} \quad (1)$$

#### NOTE

This comparator is completely separate from the rest of the circuitry, and may be employed for other functions as needed.

### 7.3.5 Low-Line Output ( $\overline{\text{LLO}}$ )

The low-line output comparator is typically used to provide a non-maskable interrupt to a  $\mu\text{P}$  when  $V_{\text{CC}}$  begins falling.  $\overline{\text{LLO}}$  monitors  $V_{\text{CC}}$  and goes low when  $V_{\text{CC}}$  falls below  $V_{\text{LLOT}}$  (typically  $1.02 \times V_{\text{RST}}$ ) with hysteresis of  $0.0032 \times V_{\text{RST}}$ .

## 7.4 Device Functional Modes

### 7.4.1 $\overline{\text{RESET}}$ Output Low

Anytime  $V_{\text{CC}}$  drops below the reset threshold, the  $\overline{\text{RESET}}$  output drops low and remains low until  $V_{\text{CC}}$  rises above the threshold and the reset time-out period has expired. The manual reset input ( $\overline{\text{MR}}$ ) also causes the reset to be active. If  $\overline{\text{MR}}$  input is pulled below  $V_{\text{MRT}}$  for more than 25  $\mu\text{s}$ , the  $\overline{\text{RESET}}$  output drops low and remains low until  $\overline{\text{MR}}$  rises above the manual reset threshold ( $V_{\text{MRT}}$ ) and the reset time-out period has expired.

### 7.4.2 $\overline{\text{RESET}}$ Output High

The  $\overline{\text{RESET}}$  output remains high as long as  $V_{\text{CC}}$  is above the reset threshold and  $\overline{\text{MR}}$  is above the manual reset threshold ( $V_{\text{MRT}}$ ).

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LM3704 is a microprocessor supervisory circuit that provides the maximum flexibility for monitoring power supplies and battery-controlled functions. The reset threshold is typically 3.08 V but can be customized for voltages between 2.2 V and 5 V in 10-mV increments by contacting Texas Instruments. The power-fail input, which is a 1.225-V threshold detector for power-fail warning, can be adjusted using a resistor divider as shown in [Figure 11](#). This section shows various application circuits to provide different monitoring solutions.

### 8.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

**Figure 11. Monitoring Two Critical Supplies**

#### 8.2.1 Design Requirements

The component count is minimal; employing two resistors as part of a voltage-divider circuit is all that is needed for the typical application of monitoring two critical supplies shown in [Figure 11](#).

#### 8.2.2 Detailed Design Procedure

The voltage-divider circuit that connects to the power-fail reset pin is chosen such that the reset threshold at the device is 1.225 V as shown in [Figure 11](#).

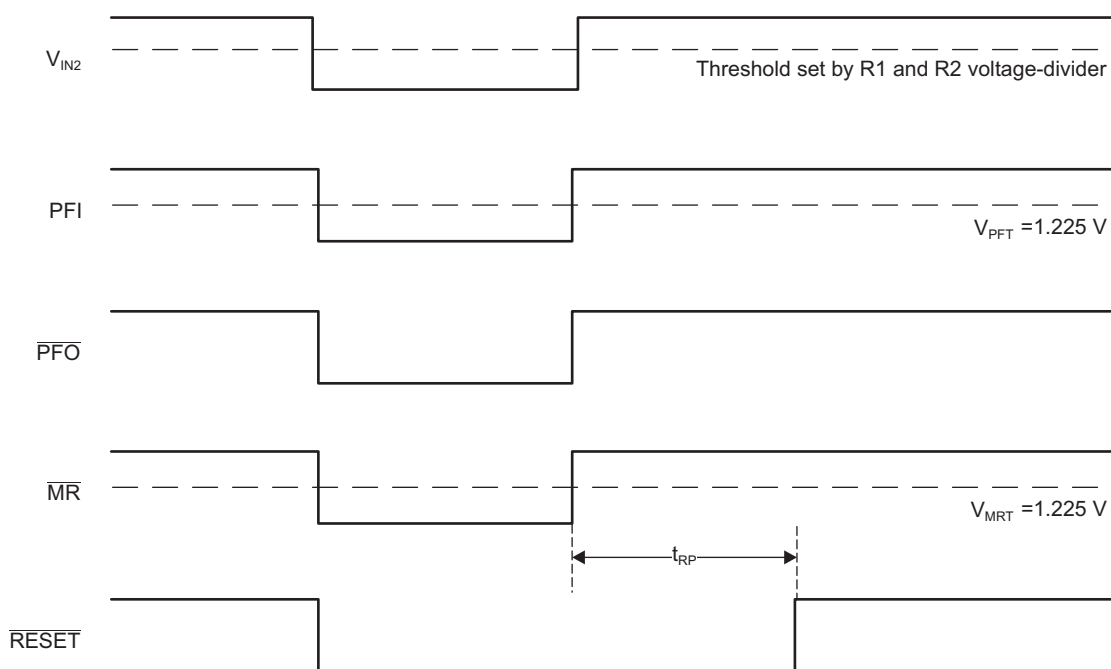

**Typical Application (continued)**

**8.2.3 Application Curves**

Standard reset threshold is 3.08 V. Custom reset voltages are available between 2.2 V and 5 V in 10-mV increments by contacting Texas Instruments.

**Figure 12. Monitoring  $V_{IN1}$  for Reset Condition**

See [Electrical Characteristics](#) for high and low levels of this specific application.

**Figure 13. Monitoring  $V_{IN2}$  for Reset Condition**

### 8.3 System Examples

The LM3704 voltage supervisor has various features such as power-fail input detection, low-line output, and manual reset while requiring few to no additional components making it versatile and easy-to-use. See Figure 14 through Figure 18 for a variety of circuit applications.

## 9 Power Supply Recommendations

The input power supply to the  $V_{CC}$  pin of the LM3704 must be kept at a voltage lower than the recommended voltage of 5.5 V. All other input pins must be kept at a voltage lower than  $V_{CC} + 0.3$  V. Do not exceed absolute maximum ratings found in [Absolute Maximum Ratings](#) in any circumstance.

## 10 Layout

Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
DSP	<a href="http://dsp.ti.com">dsp.ti.com</a>
Clocks and Timers	<a href="http://www.ti.com/clocks">www.ti.com/clocks</a>
Interface	<a href="http://interface.ti.com">interface.ti.com</a>
Logic	<a href="http://logic.ti.com">logic.ti.com</a>
