

LP38852-ADJ 1.5-A Fast-Response High-Accuracy Adjustable LDO Linear Regulator With Enable and Soft-Start

1 Features

- Input V_{IN} Range 0.93 V to 5.5 V
- Adjustable V_{OUT} Range 0.8 V to 1.8 V
- Wide V_{BIAS} Supply Operating Range 3 V to 5.5 V
- Dropout Voltage of 130 mV (Typical) at 1.5-A Load Current
- Precision Output Voltage Across All Line and Load Conditions:
 - $\pm 1.5\%$ V_{ADJ} for $T_J = 25^\circ\text{C}$
 - $\pm 2\%$ V_{ADJ} for $0^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$
 - $\pm 3\%$ V_{ADJ} for $-40^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$
- Overtemperature and Overcurrent Protection
- Stable with 10- μF Ceramic Capacitors
- Available in 7-pin TO-220, 7-Pin DDPAK/TO-263, and 8-Pin SO PowerPAD™ Packages
- -40°C to $+125^\circ\text{C}$ Operating Junction Temperature Range

2 Applications

- ASIC Power Supplies In:
 - Desktops, Notebooks, and Graphics Cards, Servers
 - Gaming Set Top Boxes, Printers and Copiers
- Server Core and I/O Supplies
- DSP and FPGA Power Supplies
- SMPS Post-Regulator

3 Description

The LP38852-ADJ is a high-current, fast-response regulator which can maintain output voltage regulation with extremely low input-to-output voltage drop. Fabricated on a CMOS process, the device operates from two input voltages: V_{BIAS} provides voltage to drive the gate of the N-MOS power transistor, while V_{IN} is the input voltage which supplies power to the load. The use of an external bias rail allows the part to operate from ultralow V_{IN} voltages. Unlike bipolar regulators, the CMOS architecture consumes extremely low quiescent current at any output load current. The use of an N-MOS power transistor results in wide bandwidth, yet minimum external capacitance is required to maintain loop stability.

The fast transient response of this device makes it suitable for use in powering DSP, microcontroller core voltages, and switch-mode power supply post-regulators.

Dropout Voltage: 130 mV (typical) at 1.5-A load current.

Low Ground Pin Current: 10 mA (typical) at 1.5-A load current.

Soft Start: Programmable soft-start time.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP38852-ADJ	DDPAK/TO-263 (7)	10.10 mm × 8.89 mm
	TO-220 (7)	14.986 × 10.16 mm
	SO PowerPAD (8)	4.89 mm × 3.90 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (April 2013) to Revision F

Page

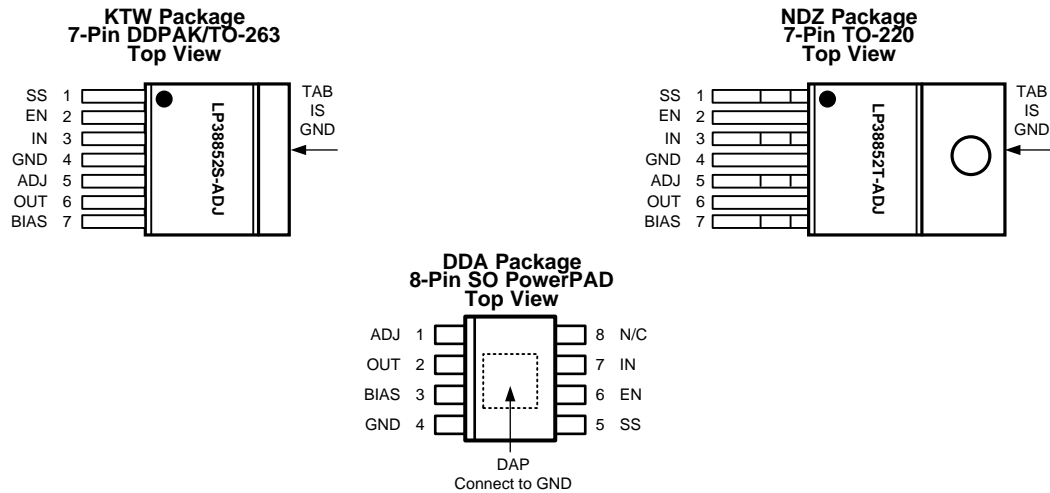

• Added <i>Device Information</i> and <i>Pin Configuration and Functions</i> sections, <i>ESD Ratings</i> and <i>Thermal Information</i> tables, <i>Feature Description</i> , <i>Device Functional Modes</i> , <i>Application and Implementation</i> , <i>Power Supply Recommendations</i> , <i>Layout</i> , <i>Device and Documentation Support</i> , and <i>Mechanical, Packaging, and Orderable Information</i> sections	1
• Deleted Lead temperature from Abs Max table; it is in POA	4
• Updated thermal information	5
• Deleted out-of-date heatsinking subsections	17

Changes from Revision D (April 2013) to Revision E

Page

• Changed layout of National Data Sheet to TI format	19

5 Pin Configuration and Functions

Pin Functions

NAME	PIN			TYPE	DESCRIPTION
	DDPAK/TO-263	TO-220	SO PowerPAD		
ADJ	5	5	1	O	The feedback connection to set the output voltage
BIAS	7	7	3	I	The supply for the internal control and reference circuitry.
EN	2	2	6	I	Device enable, High = On, Low = Off.
GND	4	4	4	GND	Ground
IN	3	3	7	I	The unregulated voltage input
N/C	-	-	8	—	No internal connection
OUT	6	6	2	O	The regulated output voltage
SS	1	1	5	O	Soft-start capacitor connection. Used to control the rise time of V_{OUT} at turnon.
TAB	TAB	TAB	—	—	The KTW and NDZ TAB is a thermal and electrical connection that is physically attached to the backside of the die, and used as a thermal heat-sink connection.
DAP	—	—	DAP	—	The SO PowerPAD DAP is a thermal connection only that is physically attached to the backside of the die, and used as a thermal heat-sink connection.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
V _{IN} supply voltage (survival)	-0.3	6	V
V _{BIAS} supply voltage (survival)	-0.3	6	V
V _{SS} soft-start voltage (survival)	-0.3	6	V
V _{OUT} voltage (survival)	-0.3	6	V
I _{OUT} current (survival)	Internally Limited		
Junction temperature	-40	150	°C
Power dissipation ⁽³⁾	Internally Limited		
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, contact the TI Sales Office/ Distributors for availability and specifications.
- (3) Device power dissipation must be de-rated based on device power dissipation (P_D), ambient temperature (T_A), and package junction to ambient thermal resistance (R_{θJA}). Additional heat-sinking may be required to ensure that the device junction temperature (T_J) does not exceed the maximum operating rating. See the [Application and Implementation](#) section for details.

6.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V _{IN} supply voltage (survival)	(V _{OUT} + V _{DO}) to V _{BIAS}			V
V _{BIAS} supply voltage (survival) ⁽¹⁾	0.8 V ≤ V _{OUT} ≤ 1.2 V		5.5	V
	1.2 V < V _{OUT} ≤ 1.8 V		5.5	V
V _{EN} voltage	0		V _{BIAS}	V
I _{OUT}	0		3	mA
Junction temperature ⁽²⁾	-40		125	°C

- (1) V_{IN} cannot exceed either V_{BIAS} or 4.5 V, whichever value is lower.
- (2) Device power dissipation must be de-rated based on device power dissipation (P_D), ambient temperature (T_A), and package junction-to-ambient thermal resistance (R_{θJA}). Additional heat sinking may be required to ensure that the device junction temperature (T_J) does not exceed the maximum operating rating. See the [Application and Implementation](#) section for details.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	LP38852-ADJ			UNIT
	KTW (DDPAK/TO-263)	NDZ (TO-220)	DDA (SO PowerPAD)	
	7 PINS	7 PINS	8 PINS	
R _{θJA} Junction-to-ambient thermal resistance	34.3	34.0	48.4	°C/W
R _{θJC(top)} Junction-to-case (top) thermal resistance	37.6	36.4	54.6	°C/W
R _{θJB} Junction-to-board thermal resistance	25.3	25.0	29.1	°C/W
ψ _{JT} Junction-to-top characterization parameter	6.6	6.3	9.6	°C/W
ψ _{JB} Junction-to-board characterization parameter	24.0	23.6	29.0	°C/W
R _{θJC(bot)} Junction-to-case (bottom) thermal resistance	n/a	n/a	4.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

Unless otherwise specified: V_{OUT} = 0.8 V, V_{IN} = V_{OUT(NOM)} + 1 V, V_{BIAS} = 3 V, V_{EN} = V_{BIAS}, I_{OUT} = 10 mA, C_{IN} = C_{OUT} = 10 μF, C_{BIAS} = 1 μF, C_{SS} = open; typical (TYP) limits are for T_J = 25°C only, and minimum (MIN) and maximum (MAX) limits apply over the junction temperature (T_J) range of –40°C to +125°C. Minimum and maximum limits are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at T_J = 25°C, and are provided for reference purposes only.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{ADJ} V _{ADJ} accuracy	V _{OUT(NOM)} +1 V ≤ V _{IN} ≤ V _{BIAS} ≤ 4.5 V ⁽¹⁾ 3 V ≤ V _{BIAS} ≤ 5.5 V, 10 mA ≤ I _{OUT} ≤ 1.5 A T _J = 25°C	492.5	500.	507.5	mV
	V _{OUT(NOM)} +1 V ≤ V _{IN} ≤ V _{BIAS} ≤ 4.5 V ⁽¹⁾ 3 V ≤ V _{BIAS} ≤ 5.5 V, 10 mA ≤ I _{OUT} ≤ 1.5 A	485		515	
	V _{OUT(NOM)} +1 V ≤ V _{IN} ≤ V _{BIAS} ≤ 4.5 V ⁽¹⁾ 3 V ≤ V _{BIAS} ≤ 5.5 V, 10 mA ≤ I _{OUT} ≤ 1.5 A, 0°C ≤ T _J ≤ +125°C	490	500.	510	
V _{OUT} V _{OUT} range	3 V ≤ V _{BIAS} ≤ 5.5 V	0.8		1.2	V

ΔV _{OUT} /ΔV _{IN} Line regulation, V _{IN} ⁽²⁾	V _{OUT(NOM)} +1 V ≤ V _{IN} ≤ V _{BIAS}		0.04		%/V
ΔV _{OUT} /ΔV _{BIAS} Line regulation, V _{BIAS} ⁽²⁾	3 V ≤ V _{BIAS} ≤ 5.5 V		0.1		%/V
ΔV _{OUT} /ΔI _{OUT} Output voltage load regulation ⁽³⁾	10 mA ≤ I _{OUT} ≤ 1.5 A		0.2		%/A
V _{DO} Dropout voltage ⁽⁴⁾	I _{OUT} = 1.5 A, T _J = 25°C		130	165	mV
	I _{OUT} = 1.5 A			180	
I _{GND(IN)} Quiescent current drawn from V _{IN} supply	V _{OUT} = 0.8 V, V _{BIAS} = 3 V 10 mA ≤ I _{OUT} ≤ 1.5 A T _J = 25°C		7	8.5	mA
	V _{OUT} = 0.8 V, V _{BIAS} = 3 V 10 mA ≤ I _{OUT} ≤ 1.5 A			9	
	V _{EN} ≤ 0.5 V, T _J = 25°C		1	100	μA
	V _{EN} ≤ 0.5 V			300	
I _{GND(BIAS)} Quiescent current drawn from V _{BIAS} supply	10 mA ≤ I _{OUT} ≤ 1.5 A, T _J = 25°C		3	3.8	mA
	10 mA ≤ I _{OUT} ≤ 1.5 A			4.5	
	V _{EN} ≤ 0.5 V, T _J = 25°C		100	170	μA
	V _{EN} ≤ 0.5 V			200	

(1) V_{IN} cannot exceed either V_{BIAS} or 4.5 V, whichever value is lower.

(2) Output voltage line regulation is defined as the change in output voltage from nominal value resulting from a change in input voltage.

(3) Output voltage load regulation is defined as the change in output voltage from nominal value as the load current increases from no load to full load.

(4) Dropout voltage is defined as the input to output voltage differential (V_{IN} – V_{OUT}) where the input voltage is low enough to cause the output voltage to drop 2% from the nominal value.

Electrical Characteristics (continued)

Unless otherwise specified: $V_{OUT} = 0.8\text{ V}$, $V_{IN} = V_{OUT(NOM)} + 1\text{ V}$, $V_{BIAS} = 3\text{ V}$, $V_{EN} = V_{BIAS}$, $I_{OUT} = 10\text{ mA}$, $C_{IN} = C_{OUT} = 10\text{ }\mu\text{F}$, $C_{BIAS} = 1\text{ }\mu\text{F}$, $C_{SS} = \text{open}$; typical (TYP) limits are for $T_J = 25^\circ\text{C}$ only, and minimum (MIN) and maximum (MAX) limits apply over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$. Minimum and maximum limits are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only.

7 Detailed Description

7.1 Overview

The LP38852-ADJ is a high-current, low-dropout, fast-response linear regulator capable of sourcing 1.5-A load with only 130-mV dropout. This device operates from two input voltages: V_{BIAS} provides voltage to internal circuit, while V_{IN} is the input voltage supplying power to load. The use of an external bias rail allows the part to operate from ultra-low V_{IN} voltages. The fast transient response of this device makes it suitable for powering DSP, microcontroller cores, and post-regulators.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Undervoltage Lockout (UVLO)

The bias voltage is monitored by a circuit which prevents the device from functioning when the bias voltage is below the UVLO threshold of approximately 2.45 V.

As the bias voltage rises above the UVLO threshold the device control circuitry becomes active. There is approximately 150 mV of hysteresis built into the UVLO threshold to provide noise immunity.

When the bias voltage is between the UVLO threshold and the minimum operating rating value of 3 V the device is functional, but the operating parameters are not within the specified limits.

7.3.2 Supply Sequencing

There is no requirement for the order that V_{IN} or V_{BIAS} are applied or removed.

One practical limitation is that the soft-start circuit starts charging soft-start timing capacitor (C_{SS}) when both V_{BIAS} rises above the UVLO threshold and the EN pin is above the $V_{EN(ON)}$ threshold. If the application of V_{IN} is delayed beyond this point the benefits of soft start is compromised.

In any case, the output voltage cannot be ensured until both V_{IN} and V_{BIAS} are within the range of specified operating values.

If used in a dual-supply system where the regulator output load is returned to a negative supply, the OUT pin must be diode clamped to ground. A Schottky diode is recommended for this diode clamp.

Feature Description (continued)

7.3.3 Reverse Voltage

A reverse voltage condition exists when the voltage at the OUT pin is higher than the voltage at the IN pin. Typically this happens when V_{IN} is abruptly taken low, and C_{OUT} continues to hold a sufficient charge such that the input to output voltage becomes reversed.

The NMOS pass element, by design, contains no body diode. This means that, as long as the gate of the pass element is not driven, there is no reverse current flow through the pass element during a reverse voltage event. The gate of the pass element is not driven when V_{BIAS} is below the UVLO threshold, or when the EN pin is held low.

When V_{BIAS} is above the UVLO threshold, and the EN pin is above the $V_{EN(ON)}$ threshold, the control circuitry is active and attempts to regulate the output voltage. Because the input voltage is less than the output voltage the control circuit drives the gate of the pass element to the full V_{BIAS} potential when the output voltage begins to fall. In this condition, reverse current flows from the OUT pin to the IN pin, limited only by the $R_{DS(ON)}$ of the pass element and the output-to-input voltage differential. Discharging an output capacitor up to 1000 μF in this manner does not damage the device as the current rapidly decays. However, continuous reverse current must be avoided.

7.3.4 Soft-Start

The LP38852-ADJ incorporates a soft-start function that reduces the start-up current surge into the output capacitor (C_{OUT}) by allowing V_{OUT} to rise slowly to the final value. This is accomplished by controlling V_{REF} at the SS pin. C_{SS} is internally held to ground until both V_{BIAS} rises above the UVLO threshold and the EN pin is higher than the $V_{EN(ON)}$ threshold.

V_{REF} rises at an RC rate defined by the internal resistance of the SS pin (r_{SS}) and the external capacitor connected to the SS pin. This allows the output voltage to rise in a controlled manner until steady-state regulation is achieved. Typically, five time constants are recommended to assure that the output voltage is sufficiently close to the final steady-state value. During the soft-start time the output current can rise to the built-in current limit.

$$\text{Soft-Start Time} = C_{SS} \times r_{SS} \times 5 \quad (1)$$

Because the V_{OUT} rise is exponential, not linear, the in-rush current peaks during the first time constant (τ), and V_{OUT} requires four additional time constants (4τ) to reach the final value (5τ).

After achieving normal operation, if either V_{BIAS} falls below the ULVO threshold, or the EN pin falls below the $V_{EN(OFF)}$ threshold, the device output is disabled, and the C_{SS} discharge circuit becomes active. The C_{SS} discharge circuit remains active until V_{BIAS} falls to 500 mV (typical). When V_{BIAS} falls below 500 mV (typical), the C_{SS} discharge circuit ceases to function due to a lack of sufficient biasing to the control circuitry.

Because V_{REF} appears on the SS pin, any leakage through C_{SS} causes V_{REF} to fall, thus affecting V_{OUT} . A leakage of 50 nA (about 10 M Ω) through C_{SS} causes V_{OUT} to be approximately 0.1% lower than nominal, while a leakage of 500 nA (about 1 M Ω) causes V_{OUT} to be approximately 1% lower than nominal. Typical ceramic capacitors have a factor of 10 \times difference in leakage between 25 $^{\circ}\text{C}$ and 85 $^{\circ}\text{C}$, so the maximum ambient temperature must be included in the capacitor selection process.

Typical C_{SS} values are in the range of 1 nF to 100 nF, providing typical soft-start times in the range of 70 μs to 7 ms (5τ). Values less than 1 nF may be used, but the soft-start effect is minimal. Values larger than 100 nF provide soft start but may not be fully discharged if V_{BIAS} falls from the UVLVO threshold to less than 500 mV in less than 100 μs .

[Figure 22](#) shows the relationship between the C_{OUT} value and a typical C_{SS} value.

Feature Description (continued)

Figure 22. Typical C_{SS} vs C_{OUT} Values

The C_{SS} capacitor must be connected to a clean ground path back to the device ground pin. No components, other than C_{SS}, should be connected to the SS pin, as there could be adverse effects to V_{OUT}.

If the soft-start function is not needed the SS pin must be left open, although some minimal capacitance value is always recommended.

7.3.5 Setting The Output Voltage

The output voltage is set using the external resistive divider R1 and R2. (Refer to the [Figure 23](#).) The output voltage is given by [Equation 2](#):

$$V_{OUT} = V_{ADJ} \times \left(1 + \left(\frac{R1}{R2} \right) \right) \quad (2)$$

The resistors used for R1 and R2 must be high quality, tight tolerance, and with matching temperature coefficients. It is important to remember that, although the value of V_{ADJ} is specified, the use of low quality resistors for R1 and R2 can easily produce a V_{OUT} value that is unacceptable.

It is recommended that the values selected for R1 and R2 are such that the parallel value is less than 10 kΩ. This is to prevent internal parasitic capacitances on the ADJ pin from interfering with the F_Z pole set by R1 and C_{FF}.

$$\left(\frac{R1 \times R2}{R1 + R2} \right) \leq 10 \text{ k}\Omega \quad (3)$$

[Table 1](#) lists some suggested, best fit, standard ±1% resistor values for R1 and R2, and a standard ±10% capacitor values for C_{FF}, for a range of V_{OUT} values. Other values of R1, R2, and C_{FF} are available that give similar results.

Table 1. Suggested Resistor Values

V _{OUT}	R1	R2	C _{FF}	F _Z
0.8 V	1.07 kΩ	1.78 kΩ	12 nF	12.4 kHz
0.9 V	1.50 kΩ	1.87 kΩ	8.2 nF	12.9 kHz
1 V	1.00 kΩ	1.00 kΩ	12 nF	13.3 kHz
1.1 V	1.65 kΩ	1.37 kΩ	8.2 nF	11.8 kHz
1.2 V	1.40 kΩ	1.00 kΩ	10 nF	11.4 kHz
1.3 V	1.15 kΩ	715 Ω	12 nF	11.5 kHz
1.4 V	1.07 kΩ	590 Ω	12 nF	12.4 kHz
1.5 V	2.00 kΩ	1.00 kΩ	6.8 nF	11.7 kHz
1.6 V	1.65 kΩ	750 Ω	8.2 nF	11.8 kHz
1.7 V	2.55 kΩ	1.07 kΩ	5.6 nF	11.1 kHz
1.8 V	2.94 kΩ	1.13 kΩ	4.7 nF	11.5 kHz

Please refer to the TI Application Note AN-1378 *Method for Calculating Output Voltage Tolerances in Adjustable Regulators* ([SNVA112](#)) for additional information on how resistor tolerances affect the calculated V_{OUT} value.

7.3.6 Enable (EN)

The EN pin provides a mechanism to enable, or disable, the regulator output stage. The EN pin has an internal pullup to V_{BIAS} through a 180-kΩ (typical) resistor. The EN pin can be left open or connected V_{BIAS} if the enable function is not needed.

7.4 Device Functional Modes

7.4.1 Input Voltage

The input voltage (V_{IN}) is the high-current external voltage rail that is regulated down to a lower voltage, which is applied to the load. The input voltage must be at least V_{OUT} + V_{DO} and no higher than whatever value is used for V_{BIAS}.

For applications where V_{BIAS} is higher than 4.5 V, V_{IN} must be no greater than 4.5 V, otherwise output voltage accuracy may be affected.

7.4.2 Bias Voltage

The bias voltage (V_{BIAS}) is a low-current external voltage rail required to bias the control circuitry and provide gate drive for the N-FET pass transistor. When V_{OUT} is set to 1.2 V, or less, V_{BIAS} may be anywhere in the operating range of 3 V to 5.5 V. If V_{OUT} is set higher than 1.2 V, V_{BIAS} must be between 4.5 V and 5.5 V to ensure proper operation of the device.

7.4.3 Enable (EN) Operation

If the EN pin is actively driven, pulling the EN pin above the V_{EN} threshold of 1.25 V (typical) turns on the regulator output; pulling the EN pin below the V_{EN} threshold turns off the regulator output. There is approximately 100 mV of hysteresis built into the enable threshold provide noise immunity.

If the enable function is not needed the EN pin must be left open, or connected directly to V_{BIAS}. If the EN pin is left open, stray capacitance on this pin must be minimized; otherwise, the output turnon is delayed while the stray capacitance is charged through the internal resistance (r_{EN}).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The typical applications of the LP38852-ADJ include DSP supply, microcontroller supplies, and post regulators.

8.2 Typical Application

Figure 23 shows the typical application circuit for LP38852-ADJ.

Figure 23. LP38852-ADJ Typical Application

8.2.1 Design Requirements

For typical linear regulator applications, use the parameters listed in Table 2.

Table 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	3.3 V
Adjustable output voltage	0.8 V to 1.8 V
Output current	1.5 A

8.2.2 Detailed Design Procedure

8.2.2.1 External Capacitors

To assure regulator stability, input and output capacitors are required as shown in the Figure 23.

8.2.2.1.1 Input Capacitor

The input capacitor must be at least 10 µF, but can be increased without limit. Its purpose is to provide a low source impedance for the regulator input. A ceramic capacitor, X5R or X7R, is recommended.

Tantalum capacitors may also be used at the input pin. There is no specific equivalent series resistance (ESR) limitation on the input capacitor (the lower, the better).

Aluminum electrolytic capacitors can be used, but are not recommended as their ESR increases very quickly at cold temperatures. They are not recommended for any application where the ambient temperature falls below 0°C.

8.2.2.1.2 Output Capacitor

A minimum output capacitance of 10 μF , ceramic, is required for stability. The amount of output capacitance can be increased without limit. The output capacitor must be located less than 1 cm from the output pin of the device and returned to the device ground pin with a clean analog ground.

Only high-quality ceramic types such as X5R or X7R are recommended, as the Z5U and Y5F types do not provide sufficient capacitance over temperature.

Tantalum capacitors also provide stable operation across the entire operating temperature range. However, the effects of ESR may provide variations in the output voltage during fast load transients. Using the minimum recommended 10- μF ceramic capacitor at the output allows unlimited capacitance, tantalum or aluminum, to be added in parallel.

8.2.2.1.3 Bias Capacitor

The capacitor on the bias pin must be at least 1 μF and can be any good-quality capacitor (ceramic is recommended).

8.2.2.1.4 Setting the Output Voltage

According to [Table 1](#), R1 is set to 1.07 k Ω , and R2 is set to 1.78 k Ω .

8.2.2.1.5 Feed Forward Capacitor, C_{FF}

When using a ceramic capacitor for C_{OUT} , the typical ESR value is too small to provide any meaningful positive phase compensation, F_Z , to offset the internal negative phase shifts in the gain loop (see [Figure 23](#)).

$$F_Z = (1 / (2 \times \pi \times C_{\text{OUT}} \times \text{ESR})) \quad (4)$$

A capacitor placed across the gain resistor R1 provides additional phase margin to improve load transient response of the device. This capacitor, C_{FF} , in parallel with R1, forms a zero in the loop response given by the formula:

$$F_Z = (1 / (2 \times \pi \times C_{\text{FF}} \times R1)) \quad (5)$$

For optimum load transient response select C_{FF} so the zero frequency, F_Z , falls between 10 kHz and 15 kHz.

$$(C_{\text{FF}} = (1 / (2 \times \pi \times R1 \times F_Z))) \quad (6)$$

The phase lead provided by C_{FF} diminishes as the DC gain approaches unity, or V_{OUT} approaches V_{ADJ} . This is because C_{FF} also forms a pole with a frequency of:

$$F_P = (1 / (2 \times \pi \times C_{\text{FF}} \times (R1 \parallel R2))) \quad (7)$$

NOTE

It is important that at higher output voltages, where R1 is much larger than R2, the pole and zero are far apart in frequency. At lower output voltages the frequency of the pole and the zero move closer together. The phase lead provided from C_{FF} diminishes quickly as the output voltage is reduced and has no effect when $V_{\text{OUT}} = V_{\text{ADJ}}$. For this reason, relying on this compensation technique alone is adequate only for higher output voltages. For the LP38852-ADJ, the practical minimum V_{OUT} is 0.8 V when a ceramic capacitor is used for C_{OUT} .

Figure 24. F_{ZERO} and F_{POLE} vs Gain

8.2.2.2 Power Dissipation and Heat Sinking

Additional copper area for heat sinking may be required depending on the maximum device dissipation (P_D) and the maximum anticipated ambient temperature (T_A) for the device. Under all possible conditions, the junction temperature must be within the range specified under operating conditions.

The total power dissipation of the device is the sum of three different points of dissipation in the device.

The first part is the power that is dissipated in the NMOS pass element, and can be determined with Equation 8:

$$P_{D(PASS)} = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (8)$$

The second part is the power that is dissipated in the bias and control circuitry and can be determined with Equation 9:

$$P_{D(BIAS)} = V_{BIAS} \times I_{GND(BIAS)}$$

where

- $I_{GND(BIAS)}$ is the portion of the operating ground current of the device that is related to V_{BIAS} . (9)

The third part is the power that is dissipated in portions of the output stage circuitry and can be determined with Equation 10:

$$P_{D(IN)} = V_{IN} \times I_{GND(IN)}$$

where

- $I_{GND(IN)}$ is the portion of the operating ground current of the device that is related to V_{IN} . (10)

The total power dissipation is then:

$$P_D = P_{D(PASS)} + P_{D(BIAS)} + P_{D(IN)} \quad (11)$$

The maximum allowable junction temperature rise (ΔT_J) depends on the maximum anticipated ambient temperature (T_A) for the application, and the maximum allowable operating junction temperature ($T_{J(MAX)}$).

$$\Delta T_J = T_{J(MAX)} - T_{A(MAX)} \quad (12)$$

The maximum allowable value for junction-to-ambient thermal resistance, $R_{\theta JA}$, can be calculated using Equation 13:

$$R_{\theta JA} \leq \Delta T_J / P_D \quad (13)$$

8.2.3 Application Curves

Figure 26. Load Transient Response

Figure 27. Load Transient Response

Figure 28. Load Transient Response

Figure 29. Load Transient Response

Figure 30. Load Transient Response

9 Power Supply Recommendations

The LP38852-ADJ device is designed to operate from an input voltage supply range between 3 V and 5.5 V. The input voltage range provides adequate headroom in order for the device to have a regulated output. This input supply must be well regulated. An input capacitor of at least 10 μF is required.

10 Layout

10.1 Layout Guidelines

For best overall performance, place all circuit components on the same side of the circuit board and as near to the respective LDO pin connections as practical. Place ground return connections to the input and output capacitor, and to the LDO ground pin, as close to each other as possible, connected by a wide, component-side, copper surface. The use of vias and long traces to create LDO circuit connections is strongly discouraged and negatively affects system performance. This grounding and layout scheme minimizes inductive parasitic, and thereby reduces load current transients, minimizes noise, and increases circuit stability.

A ground reference plane is also recommended and is either embedded in the PCB itself or located on the bottom side of the PCB opposite the components. This reference plane serves to assure accuracy of the output voltage, shield noise, and it behaves similarly to a thermal plane to spread heat from the LDO device when connected to the SO PowerPAD. In most application, this ground plane is necessary to meet thermal requirements.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
