

# LP3990

## 150mA Linear Voltage Regulator for Digital Applications

### General Description

The LP3990 regulator is designed to meet the requirements of portable, battery-powered systems providing an accurate output voltage, low noise, and low quiescent current. The LP3990 will provide a 0.8V output from the low input voltage of 2V at up to 150mA load current. When switched into shutdown mode via a logic signal at the enable pin, the power consumption is reduced to virtually zero.

The LP3990 is designed to be stable with space saving ceramic capacitors as small as 0.47µF.

Performance is specified for a -40°C to 125°C junction temperature range.

For output voltages other than 0.8V, 1.35V, 1.5V, 1.8V, 2.5V, 2.8V, or 3.3V please contact your local NSC sales office.

### Features

- 1% Voltage Accuracy at Room Temperature
- Stable with Ceramic Capacitor
- Logic Controlled Enable
- No Noise Bypass Capacitor Required
- Thermal-Overload and Short-Circuit Protection

### Key Specifications

■ Input Voltage Range	2.0 to 6.0V
■ Output Voltage Range	0.8 to 3.3V
■ Output Current	150mA
■ Output Stable - Capacitors	0.47µF
■ Virtually Zero I <sub>Q</sub> (Disabled)	<10nA
■ Very Low I <sub>Q</sub> (Enabled)	43µA
■ Low Output Noise	150µV <sub>RMS</sub>
■ PSRR	55dB at 1kHz
■ Fast Start Up	105µs

### Package

All available in Lead Free option.

4 Pin micro SMD 1 mm x 1.28mm

6 pin LLP (SOT23 footprint)

SOT23 - 5

For other package options contact your NSC sales office.

### Applications

- Cellular Handsets
- Hand-Held Information Appliances

### Typical Application Circuit

20076801

# Pin Descriptions

## Packages

Pin No			Symbol	Name and Function
LLP	micro SMD	SOT23-5		
5	A2	3	$V_{EN}$	Enable Input; Enables the Regulator when $\geq 0.95V$ . Disables the Regulator when $\leq 0.4V$ . Enable Input has $1M\Omega$ pulldown resistor to GND.
2	A1	2	GND	Common Ground. Connect to Pad.
1	B1	5	$V_{OUT}$	Voltage output. A $0.47\mu F$ Low ESR Capacitor should be connected to this Pin. Connect this output to the load circuit.
6	B2	1	$V_{IN}$	Voltage Supply Input. A $1.0\mu F$ capacitor should be connected at this input.
3		4	N/C	No Connection. Do not connect to any other pin.
4			N/C	No Connection. Do not connect to any other pin.
Pad			GND	Common Ground. Connect to Pin 2.

## Absolute Maximum Ratings

(Notes 1, 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Input Voltage	-0.3 to 6.5V
Output Voltage	-0.3 to ( $V_{IN} + 0.3V$ ) to 6.5V (max)
Enable Input Voltage	-0.3 to ( $V_{IN} + 0.3V$ ) to 6.5V (max)
Junction Temperature	150°C
Lead/Pad Temp. (Note 3)	
LLP/SOT23	235°C
micro SMD	260°C
Storage Temperature	-65 to 150°C
Continuous Power Dissipation Internally Limited(Note 4)	

ESD (Note 5)

Human Body Model	2KV
Machine Model	200V

## Operating Ratings (Note 1)

Input Voltage	2V to 6V
Enable Input Voltage	0 to ( $V_{IN} + 0.3V$ ) to 6.0V (max)
Junction Temperature	-40°C to 125°C
Ambient Temperature $T_A$ Range (Note 6)	-40°C to 85°C

## Thermal Properties (Note 1)

Junction To Ambient Thermal Resistance (Note 8)	
$\theta_{JA}$ (LLP-6)	88°C/W
$\theta_{JA}$ (microSMD)	220°C/W
$\theta_{JA}$ SOT23-5	220°C/W

## Electrical Characteristics

Unless otherwise noted,  $V_{EN} = 950mV$ ,  $V_{IN} = V_{OUT} + 1.0V$ , or 2.0V, whichever is higher.  $C_{IN} = 1 \mu F$ ,  $I_{OUT} = 1 mA$ ,  $C_{OUT} = 0.47 \mu F$ . Typical values and limits appearing in normal type apply for  $T_J = 27^\circ C$ . Limits appearing in **boldface** type apply over the full junction temperature range for operation, -40 to +125°C. (Note 13)

Transient Response	Line Transient Response $ \delta V_{OUT} $	$T_{\text{rise}} = T_{\text{fall}} = 30\mu\text{s}$ (Note 10) $\delta V_{IN} = 600\text{mV}$	8		<b>16</b>	mV (pk - pk)	
	Load Transient Response $ \delta V_{OUT} $	$T_{\text{rise}} = T_{\text{fall}} = 1\mu\text{s}$ (Note 10) $I_{OUT} = 1\text{mA}$ to $150\text{mA}$ $C_{OUT} = 1\mu\text{F}$	55		<b>80</b>	mV	

**Note 1:** Absolute Maximum Ratings are limits beyond which damage can occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

**Note 2:** All Voltages are with respect to the potential at the GND pin.

**Note 3:** For further information on these packages please refer to the following application notes; AN-1112 Micro SMD Package Wafer Level Chip Scale Package, AN-1187 Leadless Leadframe Package.

**Note 4:** Internal thermal shutdown circuitry protects the device from permanent damage.

**Note 5:** The human body model is  $100\text{pF}$  discharged through a  $1.5\text{k}\Omega$  resistor into each pin. The machine model is a  $200\text{pF}$  capacitor discharged directly into each pin.

**Note 6:** The maximum ambient temperature ( $T_{A(\text{max})}$ ) is dependant on the maximum operating junction temperature ( $T_{J(\text{max-op})} = 125^\circ\text{C}$ ), the maximum power dissipation of the device in the application ( $P_{D(\text{max})}$ ), and the junction to ambient thermal resistance of the part/package in the application ( $\theta_{JA}$ ), as given by the following equation:  $T_{A(\text{max})} = T_{J(\text{max-op})} - (\theta_{JA} \times P_{D(\text{max})})$ .

**Note 7:** Dropout voltage is voltage difference between input and output at which the output voltage drops to  $100\text{mV}$  below its nominal value. This parameter only for output voltages above  $2.0\text{V}$ .

**Note 8:** Junction to ambient thermal resistance is dependant on the application and board layout. In applications where high maximum power dissipation is possible, special care must be paid to thermal dissipation issues in board design.

**Note 9:** The device maintains the regulated output voltage without the load.

**Note 10:** This electrical specification is guaranteed by design.

**Note 11:** Short circuit current is measured with  $V_{OUT}$  pulled to  $0\text{V}$  and  $V_{IN}$  worst case =  $6.0\text{V}$ .

**Note 12:** Enable Pin has  $1\text{M}\Omega$  typical, resistor connected to GND.

**Note 13:** All limits are guaranteed. All electrical characteristics having room-temperature limits are tested during production at  $T_J = 25^\circ\text{C}$  or correlated using Statistical Quality Control methods. Operation over the temperature specification is guaranteed by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

**Note 14:**  $V_{IN(\text{MIN})} = V_{OUT(\text{NOM})} + 0.5\text{V}$ , or  $2.0\text{V}$ , whichever is higher.

## Output Capacitor, Recommended Specifications

Symbol	Parameter	Conditions	Typ	Limit		Units
				Min	Max	
$C_{OUT}$	Output Capacitor	Capacitance (Note 15)	$-40^\circ\text{C}$ to $+125^\circ\text{C}$	1.0	<b>0.68</b>	$\mu\text{F}$
			$0^\circ\text{C}$ to $+125^\circ\text{C}$	0.47	0.33	
		ESR		5	500	$\text{m}\Omega$

## Output Capacitor, Recommended Specifications (Continued)

**Note 15:** The capacitor tolerance should be 30% or better over temperature. The full operating conditions for the application should be considered when selecting a suitable capacitor to ensure that the minimum value of capacitance is always met. Recommended capacitor type is X7R. However, dependent on application, X5R, Y5V, and Z5U can also be used. (See capacitor section in Applications Hints)

**Typical Performance Characteristics.** Unless otherwise specified,  $C_{IN} = 1.0\mu\text{F}$  Ceramic,  $C_{OUT} = 0.47\mu\text{F}$  Ceramic,  $V_{IN} = V_{OUT(NOM)} + 1.0\text{V}$ ,  $T_A = 25^\circ\text{C}$ ,  $V_{OUT(NOM)} = 1.5\text{V}$ , Shutdown pin is tied to  $V_{IN}$ .

## Application Hints

### EXTERNAL CAPACITORS

In common with most regulators, the LP3990 requires external capacitors for regulator stability. The LP3990 is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

### INPUT CAPACITOR

An input capacitor is required for stability. It is recommended that a 1.0 $\mu$ F capacitor be connected between the LP3990 input pin and ground (this capacitance value may be increased without limit).

This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analogue ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input.

**Important:** Tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it must be guaranteed by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the ESR (Equivalent Series Resistance) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will remain  $\approx$  1.0 $\mu$ F over the entire operating temperature range.

### OUTPUT CAPACITOR

The LP3990 is designed specifically to work with very small ceramic output capacitors. A 0.47 $\mu$ F ceramic capacitor (temperature types Z5U, Y5V or X7R) with ESR between 5m $\Omega$  to 500m $\Omega$ , is suitable in the LP3990 application circuit.

For this device the output capacitor should be connected between the V<sub>OUT</sub> pin and ground.

It is also possible to use tantalum or film capacitors at the device output, C<sub>OUT</sub> (or V<sub>OUT</sub>), but these are not as attractive for reasons of size and cost (see the section Capacitor Characteristics).

The output capacitor must meet the requirement for the minimum value of capacitance and also have an ESR value that is within the range 5m $\Omega$  to 500m $\Omega$  for stability.

### NO-LOAD STABILITY

The LP3990 will remain stable and in regulation with no external load. This is an important consideration in some circuits, for example CMOS RAM keep-alive applications.

### CAPACITOR CHARACTERISTICS

The LP3990 is designed to work with ceramic capacitors on the output to take advantage of the benefits they offer. For capacitance values in the range of 0.47 $\mu$ F to 4.7 $\mu$ F, ceramic capacitors are the smallest, least expensive and have the lowest ESR values, thus making them best for eliminating high frequency noise. The ESR of a typical 0.47 $\mu$ F ceramic capacitor is in the range of 20m $\Omega$  to 40m $\Omega$ , which easily meets the ESR requirement for stability for the LP3990.

For both input and output capacitors, careful interpretation of the capacitor specification is required to ensure correct device operation. The capacitor value can change greatly, depending on the operating conditions and capacitor type.

In particular, the output capacitor selection should take account of all the capacitor parameters, to ensure that the specification is met within the application. The capacitance can vary with DC bias conditions as well as temperature and frequency of operation. Capacitor values will also show some decrease over time due to aging. The capacitor parameters are also dependant on the particular case size, with smaller sizes giving poorer performance figures in general. As an example, *Figure 1* shows a typical graph comparing different capacitor case sizes in a Capacitance vs. DC Bias plot. As shown in the graph, increasing the DC Bias condition can result in the capacitance value falling below the minimum value given in the recommended capacitor specifications table (0.33 $\mu$ F in this case). Note that the graph shows the capacitance out of spec for the 0402 case size capacitor at higher bias voltages. It is therefore recommended that the capacitor manufacturers' specifications for the nominal value capacitor are consulted for all conditions, as some capacitor sizes (e.g. 0402) may not be suitable in the actual application.

20076840

**FIGURE 1. Graph Showing a Typical Variation in Capacitance vs DC Bias**

The ceramic capacitor's capacitance can vary with temperature. The capacitor type X7R, which operates over a temperature range of -55°C to +125°C, will only vary the capacitance to within  $\pm$ 15%. The capacitor type X5R has a similar tolerance over a reduced temperature range of -55°C to +85°C. Many large value ceramic capacitors, larger than 1 $\mu$ F are manufactured with Z5U or Y5V temperature characteristics. Their capacitance can drop by more than 50% as the temperature varies from 25°C to 85°C. Therefore X7R is recommended over Z5U and Y5V in applications where the ambient temperature will change significantly above or below 25°C.

Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more expensive when comparing equivalent capacitance and voltage ratings in the 0.47 $\mu$ F to 4.7 $\mu$ F range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. This means that while it may be possible to find a tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly) than a ceramic capacitor with the same ESR value. It should also be noted that the ESR of a typical

## Application Hints (Continued)

tantalum will increase about 2:1 as the temperature goes from 25°C down to -40°C, so some guard band must be allowed.

### ENABLE CONTROL

The LP3990 features an active high Enable pin,  $V_{EN}$ , which turns the device on when pulled high. When not enabled the regulator output is off and the device typically consumes 2nA.

If the application does not require the Enable switching feature, the  $V_{EN}$  pin should be tied to  $V_{IN}$  to keep the regulator output permanently on.

To ensure proper operation, the signal source used to drive the  $V_{EN}$  input must be able to swing above and below the specified turn-on/off voltage thresholds listed in the Electrical Characteristics section under  $V_{IL}$  and  $V_{IH}$ .

### Micro SMD MOUNTING

The micro SMD package requires specific mounting techniques, which are detailed in National Semiconductor Application Note AN-1112.

For best results during assembly, alignment ordinals on the PC board may be used to facilitate placement of the micro SMD device.

### Micro SMD LIGHT SENSITIVITY

Exposing the micro SMD device to direct light may affect the operation of the device. Light sources, such as halogen lamps, can affect electrical performance, if placed in close proximity to the device.

Light with wavelengths in the infra-red portion of the spectrum is the most detrimental, and so, fluorescent lighting used inside most buildings, has little or no effect on performance.
