

# Automotive Micropower Linear Regulators with Supervisor

MAX6765-MAX6774

## General Description

The MAX6765–MAX6774 are low-quiescent-current, high-voltage linear regulators that operate from 4V to 72V and deliver up to 100mA of load current. These low-power devices consume only 31 $\mu$ A of quiescent current, making them ideal for always-on automotive modules. These devices are offered with fixed standard output options of 5.0V, 3.3V, 2.5V, and 1.8V, or can be adjusted from 1.8V to 11V with two external resistors.

The MAX6765–MAX6774 feature a push-pull or open-drain, active-low  $\overline{\text{RESET}}$  output with either fixed or adjustable thresholds. Whenever the regulator's output falls below the reset threshold, the  $\overline{\text{RESET}}$  output asserts and remains asserted for at least the minimum reset timeout period after the output voltage exceeds its threshold. The minimum reset timeout period is offered with fixed values from 75 $\mu$ s to 200ms or can be adjusted externally with a small capacitor.

These devices provide three regulator enable modes to accommodate several power-on schemes. The MAX6765/MAX6766/MAX6769/MAX6770/MAX6773/MAX6774 feature a single traditional enable input (ENABLE) to turn on and off the regulator. The MAX6771/MAX6772 provide dual enable inputs (ENABLE1 and ENABLE2) to turn on and off the regulator either through an ignition switch or a bus transceiver. The MAX6767/MAX6768 provide a hold input (HOLD) in addition to the enable input to allow for the implementation of a self-holding circuit without requiring external components. Setting HOLD low after enabling the regulator forces the regulator to remain on even if ENABLE is subsequently set low. Releasing HOLD shuts down the regulator.

The MAX6773/MAX6774 also include a watchdog input that monitors a pulse train from the microprocessor ( $\mu$ P) and generates a reset pulse if the watchdog input remains high or low for a duration longer than the 1.6s (typ) watchdog timeout period.

The MAX6765–MAX6774 are available in a small, thermally enhanced 3mm x 3mm TDFN package that can dissipate up to 1.951W, thereby supporting continuous regulator operation during high ambient temperatures, high battery voltage, and high load-current conditions.

The MAX6765–MAX6774 are fully specified for a -40°C to +125°C operating temperature range.

## Applications

Automotive  
Industrial  
Telecom

Typical Application Circuit and Selector Guide appear at end of data sheet.

## Features

- ◆ Low 31 $\mu$ A Quiescent Current
- ◆ 4V to 72V Wide Input Voltage Range
- ◆ 100mA Output Current Capability
- ◆ Dropout Voltage of 620mV with 5V Output at 100mA
- ◆ Fixed Output-Voltage Options: 5V, 3.3V, 2.5V, and 1.8V
- ◆ Adjustable Output Voltages from 1.8V to 11V
- ◆ Open-Drain or Push-Pull  $\overline{\text{RESET}}$  Output
- ◆ Fixed or Capacitor-Adjustable Reset Timeouts
- ◆ Small, Thermally Enhanced 1.9W, 3mm x 3mm TDFN Package
- ◆ Overtemperature and Short-Circuit Protection
- ◆ Fully Specified from -40°C to +125°C

## Ordering Information

| PART           | TEMP RANGE      | PIN-PACKAGE | PKG CODE |
|----------------|-----------------|-------------|----------|
| MAX6765TT_D_+* | -40°C to +125°C | 6 TDFN-EP** | T633-2   |
| MAX6766TT_D_+* | -40°C to +125°C | 6 TDFN-EP** | T633-2   |

Ordering Information continued at end of data sheet.

The first “\_” is a placeholder for the voltage output and reset threshold. The 2nd “\_” designates the fixed reset-timeout option. See Tables 1 and 2 for details. For example, the MAX6765TTLD4 has a 5V output, a reset threshold of 4.65V, and a 200ms typical reset timeout.

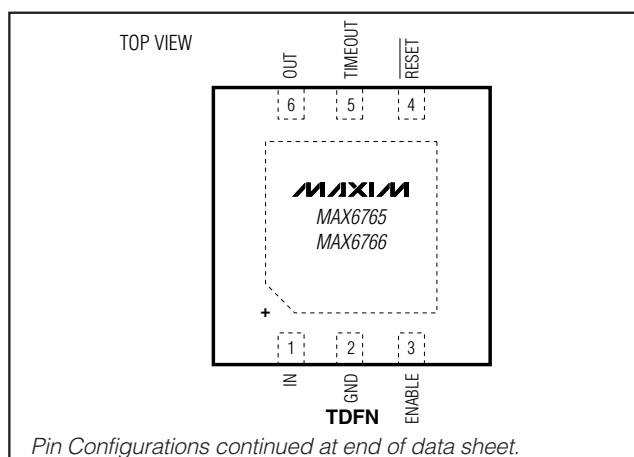

+Denotes lead-free package.

\*Future product—contact factory for availability.

\*\*EP = Exposed paddle.

For tape-and-reel orders add a “T” after the “+” symbol to complete the part number. Tape-and-reel orders are available in 2.5k increments. Nonstandard versions require a 10k minimum order quantity.

## Pin Configurations

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>IN</sub> = 14V, C<sub>IN</sub> = 0.1μF, C<sub>OUT</sub> = 10μF, T<sub>A</sub> = T<sub>J</sub> = -40°C to +125°C, unless otherwise noted. Typical values are at T<sub>A</sub> = T<sub>J</sub> = +25°C.)

**Note 1:** Production tested at  $T_A = +25^\circ C$ . Overtemperature limits are guaranteed by design.

**Note 2:** Device tested at internally set voltage.

**Note 3:** Dropout voltage for L/M versions is defined as  $(V_{IN} - V_{OUT})$  when  $V_{OUT}$  equals 98% of the nominal value of  $V_{OUT}$  when  $V_{IN} = 11V$ . For T/S versions, dropout voltage is defined as  $(V_{IN} - V_{OUT})$  when  $V_{OUT}$  equals 98% of the nominal value of  $V_{OUT}$  when  $V_{IN} = 9.3V$ .

**Note 4:** Observe the absolute maximum power dissipation limits.

|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------------|---|
| MAX6765/<br>MAX6766 | MAX6767/<br>MAX6768 | MAX6769/<br>MAX6770 | MAX6771/<br>MAX6772 | MAX6773/<br>MAX6774 |                           |   |
| 1                   | 1                   | 1                   | 1                   | 1                   | IN                        | Regulator Input. Bypass IN to GND with a capacitor with a minimum value of 0.1 $\mu$ F.   |
| 2                   | 2                   | 2                   | 2                   | 2                   | GND                       | Ground  |
| 3                   | 3                   | 3                   | —                   | 3                   | ENABLE                    | Active-High Enable Input. Drive ENABLE high to turn on the regulator. ENABLE is internally connected to GND through a 0.6 $\mu$ A current sink.   |
| 4                   | 5                   | 5                   | 5                   | 5                   | $\overline{\text{RESET}}$ | Active-Low, Open-Drain/Push-Pull Reset Output. For the MAX6769/MAX6770, $\overline{\text{RESET}}$ asserts when RESETIN is below the internal $V_{TH}$ and deasserts when RESETIN is above the internal $V_{TH}$ threshold. For all other versions, $\overline{\text{RESET}}$ remains low while OUT is below the reset threshold. For all versions, $\overline{\text{RESET}}$ remains low for the duration of the reset timeout period after the reset conditions end. |
| 5                   | 7                   | 7                   | 7                   | 7                   | TIMEOUT                   | Reset Timeout Adjust Input. Connect TIMEOUT to OUT for the internally fixed timeout period. For an adjustable timeout, connect a capacitor from TIMEOUT to GND. See the <i>Selecting Timeout Capacitor</i> section.   |
| 6                   | 8                   | 8                   | 8                   | 8                   | OUT                       | Regulator Output. The MAX6765/MAX6766 provide a fixed output (+1.8V, +2.5V, +3.3V, or +5V). The MAX6767-MAX6774 provide a fixed output voltage of +1.8V, +2.5V, +3.3V, or 5V, or adjust the output from +1.8V to +11V. Bypass to GND with a 10 $\mu$ F capacitor (min).   |

| —                   | —                   | —                   | 3                   | —                   | ENABLE1                  | Active-High Enable Input 1. Drive ENABLE1 high to turn on the regulator. ENABLE1 is internally connected to ground through a 0.6 $\mu\text{A}$ current sink.  |
| —                   | —                   | —                   | 4                   | —                   | ENABLE2                  | Active-High Enable Input 2. Drive ENABLE2 high to turn on the regulator. ENABLE2 is internally connected to ground through a 0.6 $\mu\text{A}$ current sink.  |
| —                   | —                   | —                   | —                   | 4                   | WDI                      | Watchdog Timer Input. If WDI remains high or low for longer than the watchdog timeout period, the internal watchdog timer expires and the reset output asserts for the reset timeout period. The internal watchdog timer clears whenever a reset is asserted or WDI sees a rising or falling edge. The watchdog timer cannot be disabled. Do not leave WDI unconnected.                         |
| EP                  | EP                  | EP                  | EP                  | EP                  | —                        | Exposed Paddle. EP is internally connected to GND. Connect EP to the ground plane to provide a low thermal-resistance path from the IC junction to the PCB. Do not use as the electrical connection to GND.   |

### Detailed Description

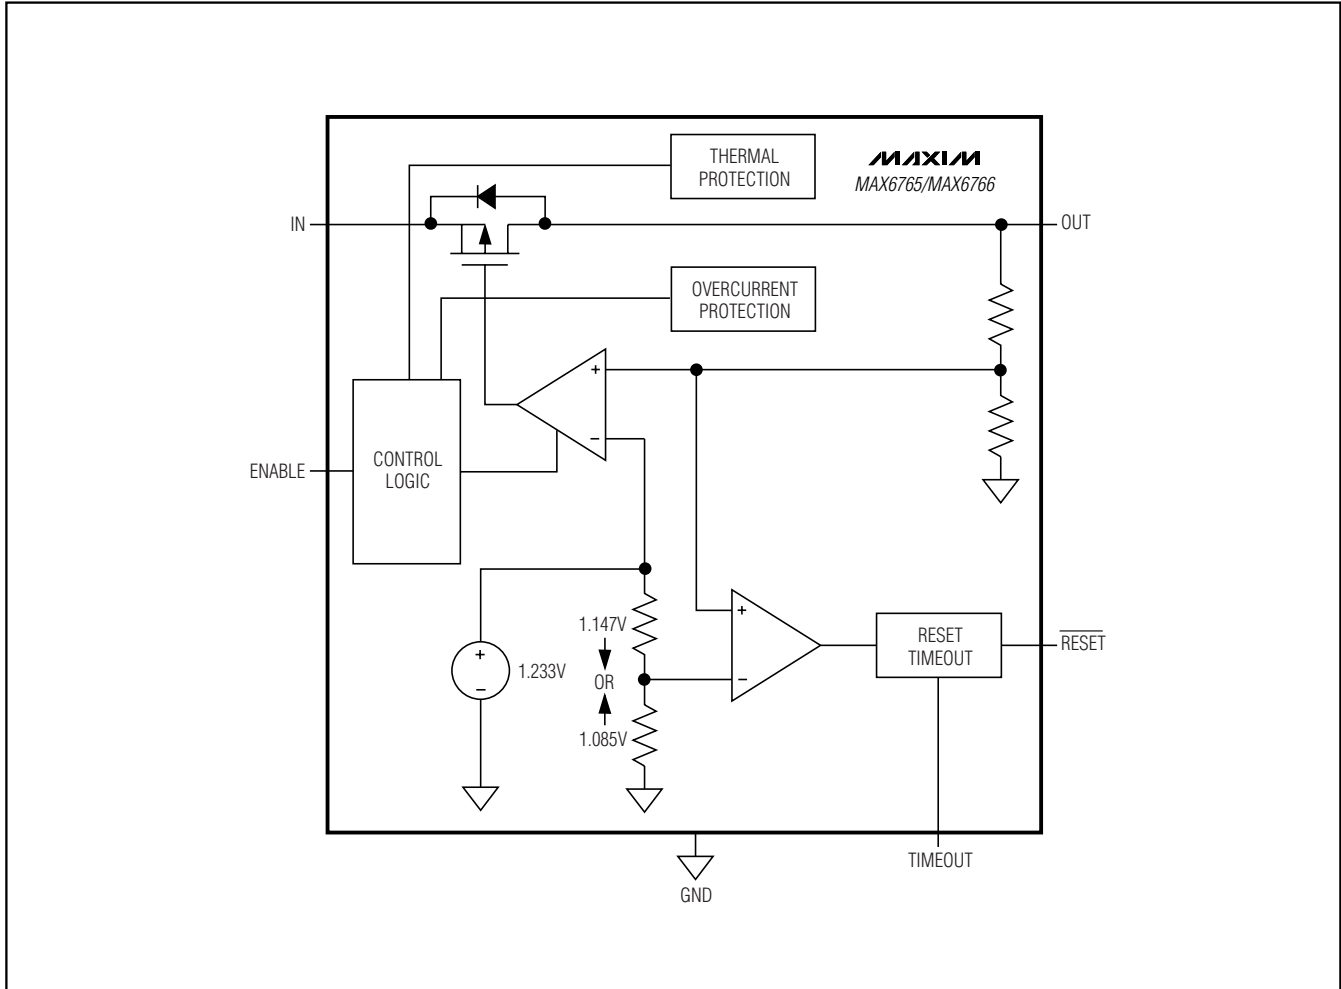

The MAX6765–MAX6774 low-quiescent-current, high-voltage linear regulators operate from a 4V to 72V input voltage and deliver more than 100mA of load current. The MAX6765–MAX6774 include an integrated  $\mu\text{P}$  reset circuit that monitors the regulator output voltage and asserts a reset output when OUT falls below a threshold limit, and includes an internally fixed or adjustable reset timeout using a capacitor from TIMEOUT to ground. All devices are available in a preset output-voltage option of

+1.8V, +2.5V, +3.3V, and +5V. The output voltage of the MAX6767–MAX6774 is adjustable from +1.8V to +11V using a resistive divider at SET. The MAX6773/MAX6774 include a watchdog timer (WDI) with a 1.6s (typ) watchdog timeout period. The MAX6769/MAX6770 feature an adjustable reset threshold using a resistive divider between the monitored voltage, RESETIN, and GND; see the *Functional Diagrams*.

The MAX6771/MAX6772 provide dual enable inputs (ENABLE1 and ENABLE2) to turn on and off the regulator either through an ignition switch or a bus transceiver.

## Regulator

The regulator accepts an input voltage from +4V to +72V. All of the devices feature fixed output-voltage options of +1.8V, +2.5V, +3.3V, and +5V. The MAX6767-MAX6774 feature an adjustable output voltage set with an external resistive-divider network connected between OUT, SET, and GND. See Figure 1.

## Enable and Hold Inputs (MAX6767/MAX6768)

The MAX6767/MAX6768 support two logic inputs, ENABLE (active-high) and HOLD (active-low), making these devices “automotive friendly.” For example, when the ignition key signal drives ENABLE high, the regulator turns on and remains on even if ENABLE goes low, as long as HOLD is forced low and kept low before ENABLE goes low. In this state, releasing HOLD turns the regulator output (OUT) off. This feature makes it possible to implement a self-holding circuit without external components. Forcing ENABLE low with HOLD high (or unconnected) places the MAX6767/MAX6768 into shut-down mode, drawing 3.3µA (typ) of supply current.

Table 3 shows the state of the regulator output with respect to the voltage level at ENABLE and HOLD. Connect HOLD to OUT or leave it unconnected to allow the ENABLE input to act as a standard enable/shut-down switch for the regulator output (OUT).

## Reset Output

The reset output is typically connected to the reset input of a µP. A µP’s reset input starts or restarts the µP in a known state. The MAX6765-MAX6774 supervisory circuits provide the reset logic to prevent code-execution errors during power-up, power-down, and brownout conditions (see the *Typical Application Circuit*). RESET changes from high to low whenever the monitored voltage drops below the reset threshold voltages. Once the monitored voltage exceeds its respective reset threshold voltage(s), RESET remains low for the reset timeout period, then goes high. See Table 1.

## RESETIN Threshold (MAX6769/MAX6770)

The MAX6769/MAX6770 monitor the voltage on RESETIN using an adjustable reset threshold (VRESETIN) set with an external resistive voltage-divider and the internal reset threshold VTH. See Table 2.

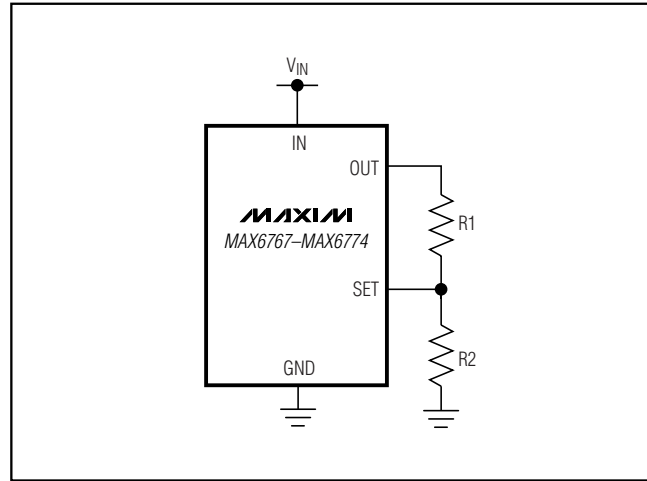

Figure 1. Setting the Output Voltage Using a Resistive Divider

Table 1. Preset Timeout Period

| PART NUMBER SUFFIX ( ) | TIMEOUT PERIOD |
|------------------------|----------------|
| D0                     | 75µs           |
| D1                     | 3.125ms        |
| D2                     | 12.5ms         |
| D3                     | 50ms           |
| D4                     | 200ms          |

Table 2. Preset Output Voltage and Reset Threshold

| PART NUMBER SUFFIX ( ) | OUTPUT VOLTAGE (V) | RESET THRESHOLD (V) |
|------------------------|--------------------|---------------------|
| L                      | 5                  | 4.625               |
| M                      | 5                  | 4.375               |
| T                      | 3.3                | 3.053               |
| S                      | 3.3                | 2.888               |
| Z                      | 2.5                | 2.313               |
| Y                      | 2.5                | 2.188               |
| W                      | 1.8                | 1.665               |
| V                      | 1.8                | 1.575               |

# Automotive Micropower Linear Regulators with Supervisor

Table 3. ENABLE/HOLD Truth Table/State Table

| OPERATING STATE  | ENABLE | HOLD               | REGULATOR OUTPUT | COMMENT  |
|------------------|--------|--------------------|------------------|--|
| Initial State    | Low    | Don't care         | Off              | ENABLE is pulled to GND through an internal pulldown. HOLD is floating (pulled up to OUT). Regulator output is disabled.   |
| Turn-On State    | High   | Don't care         | On               | ENABLE is externally driven high turning the regulator output on. HOLD is pulled up by OUT.  |
| Hold Setup State | High   | Low                | On               | HOLD is externally pulled low while ENABLE remains high (latches HOLD state).  |
| Hold State       | Low    | Low                | On               | ENABLE is driven low (or allowed to float low by an internal pulldown). HOLD remains externally pulled low keeping the regulator output on.                                |
| Off-State        | Low    | High (floats high) | Off              | HOLD is driven high (or allowed to float high by an internal pullup) while ENABLE is low. Regulator output is shut off and ENABLE/HOLD logic returns to the initial state. |

### Watchdog Timer (MAX6773/MAX6774)

The MAX6773/MAX6774 include a watchdog timer that asserts  $\overline{\text{RESET}}$  if the watchdog input (WDI) does not toggle within the watchdog timeout period  $t_{WD}$  (1.6s, typ).  $\overline{\text{RESET}}$  remains low for the reset timeout period,  $t_{RP}$ . If the watchdog is not updated for lengthy periods of time, the reset output appears as a pulse train, asserted for the reset timeout period and deasserted for the watchdog timeout period, until WDI is toggled again. When  $\overline{\text{RESET}}$  asserts, it stays low for the entire reset timeout period ignoring any WDI transitions. To prevent the watchdog from asserting  $\overline{\text{RESET}}$ , toggle WDI with a valid rising or falling edge prior to  $t_{WD}$  (min) = 1.12s. The watchdog counter clears when WDI toggles prior to  $t_{WD}$  or when  $\overline{\text{RESET}}$  asserts. The watchdog resumes counting after  $\overline{\text{RESET}}$  deasserts. The watchdog timer cannot be disabled.

### Thermal Protection

When the junction temperature exceeds  $T_J = +160^\circ\text{C}$  (typ), an internal thermal sensor signals the shutdown logic that turns off the pass transistor and allows the IC to cool. The thermal sensor turns the pass transistor on again after the IC's junction temperature cools by  $20^\circ\text{C}$  (typ), resulting in a cycled output during continuous thermal-overload conditions. Thermal protection protects the MAX6765-MAX6774 in the event of a fault condition. Never exceed the absolute maximum junction temperature rating of  $T_J = +150^\circ\text{C}$ . See Figures 3 and 4 for the safe operating area.

## Applications Information

### Output Voltage Selection

The MAX6767-MAX6774 feature dual-mode operation: these devices operate in either a preset or adjustable

voltage mode. In preset voltage mode, internal trimmed feedback resistors set the internal linear regulator to +1.8V, +2.5V, +3.3V, or +5V (see Table 2). Select preset-voltage mode by connecting SET to ground. In adjustable mode, select an output voltage between +1.8V and +11V using two external resistors connected as a voltage-divider to SET (see Figure 1). Set the output voltage using the following equation:

$$V_{OUT} = V_{SET} (1 + R1/R2)$$

where  $V_{SET} = 1.233\text{V}$  and the recommended value for  $R2$  is  $50\text{k}\Omega$  (maximum  $100\text{k}\Omega$ ).

### RESETIN Threshold Selection

The MAX6769/MAX6770 feature an adjustable reset threshold to monitor the voltage on RESETIN using a resistive divider between the monitored voltage, RESETIN and GND. See Figure 2. Use the following formula to set the desired reset threshold:

$$V_{MON} = V_{TH} (1 + R3/R4)$$

where  $V_{TH}$  is 1.085V for the M/S/Y/V versions and 1.147V for L/T/Z/W versions.

Figure 2. RESETIN Threshold Selection

# Automotive Micropower Linear Regulators with Supervisor

MAX6765-MAX6774

## Available Output-Current Calculation

The MAX6765–MAX6774 provide up to 100mA of load current. Package power dissipation limits the amount of output current available for a given input/output voltage and ambient temperature. Figures 3 and 4 depict the maximum power dissipation curve for the MAX6765/MAX6766 and MAX6767–MAX6774, respectively. The graph assumes that the exposed metal pad of the device package is soldered to a solid 1in<sup>2</sup> section of 2oz. PCB copper (JESD51-3 AND JESD51-5). Use Figure 4 to determine the allowable package dissipation for a given ambient temperature. Alternately, use the following formula to calculate the allowable package dissipation:

$P_{D_{MAX}} = \text{Max. Power Dissip} = 1.951\text{W}$ , for  $T_A \leq +70^\circ\text{C}$

$P_{D_{MAX}} = \text{Max. Power Dissip} = [1.9\text{W} - 0.0244\text{W} \times (T_A - 70^\circ\text{C})]$ , for  $+70^\circ\text{C} < T_A \leq +125^\circ\text{C}$

where 0.0244W is the MAX6767–MAX6774 package thermal derating in W/°C and  $T_A$  is the ambient temperature in °C, under the same conditions used for Figure 4.

After determining the allowable package dissipation, calculate the maximum output current using the following formula:

$$PD < P_{D_{MAX}} \text{ where } PD = [(V_{IN} - V_{OUT}) \times I_{OUT}]$$

Also,  $I_{OUT}$  should be  $\leq 100\text{mA}$  in any case.

## Selecting Timeout Capacitor

The reset timeout period is adjustable to accommodate a variety of  $\mu\text{P}$  applications. Adjust the reset timeout period by connecting a capacitor between TIMEOUT and GND.

$$t_{RP} = C_{\text{TIMEOUT}} \times 1.22 \times 10^6 \Omega$$

where  $t_{RP}$  is in seconds and  $C_{\text{TIMEOUT}}$  is in Farads.

Connect TIMEOUT to OUT to select the internally fixed timeout period.  $C_{\text{TIMEOUT}}$  must be a low-leakage ( $< 10\text{nA}$ ) type capacitor. Ceramic capacitors are recommended; do not use capacitor values lower than 100pF to avoid the influence of parasitic capacitances.

## Capacitor Selection and Regulator Stability

For stable operation over the full temperature range and with load currents up to 100mA, use a 10 $\mu\text{F}$  (min) output capacitor with an ESR  $< 0.5\Omega$ . To reduce noise and improve load-transient response, stability, and power-supply rejection, use larger output-capacitor values. Some ceramic dielectrics exhibit large capacitance and ESR variation with temperature. For dielectric capacitors such as Z5U and Y5V, use more capacitance to ensure stability at low temperatures. With X7R or X5R dielectrics, 10 $\mu\text{F}$  should be sufficient at all operating temperatures. For higher-ESR tantalum capacitors, use larger capacitor values to maintain stability. To improve power-supply rejection and transient response, use a larger capacitor than the minimum 0.1 $\mu\text{F}$  capacitor between IN and GND.

Figure 3. Maximum Power Dissipation vs. Temperature (MAX6765/MAX6766)

Figure 4. Maximum Power Dissipation vs. Temperature (MAX6767-MAX6774)

# Automotive Micropower Linear Regulators with Supervisor

## Ensuring a Valid $\overline{\text{RESET}}$ Output Down to $V_{\text{IN}} = 0\text{V}$ (MAX6766/MAX6768/MAX6770/MAX6772/MAX6774)

When  $V_{\text{IN}}$  falls below 1V,  $\overline{\text{RESET}}$  current-sinking capabilities decline drastically. High-impedance CMOS-logic inputs connected to  $\overline{\text{RESET}}$  can drift to undetermined voltages. This presents no problems in most applications, since most  $\mu\text{Ps}$  and other circuitry do not operate with supply voltages below 1V. In those applications where  $\overline{\text{RESET}}$  must be valid down to 0V, adding a pull-down resistor between  $\overline{\text{RESET}}$  and ground sinks any stray leakage currents, holding  $\overline{\text{RESET}}$  low (Figure 5). The value of the pull-down resistor is not critical; 100k $\Omega$  is large enough not to load  $\overline{\text{RESET}}$  and small enough to pull  $\overline{\text{RESET}}$  to ground. Open-drain  $\overline{\text{RESET}}$  versions are not recommended for applications requiring valid logic for  $V_{\text{IN}}$  down to 0V.

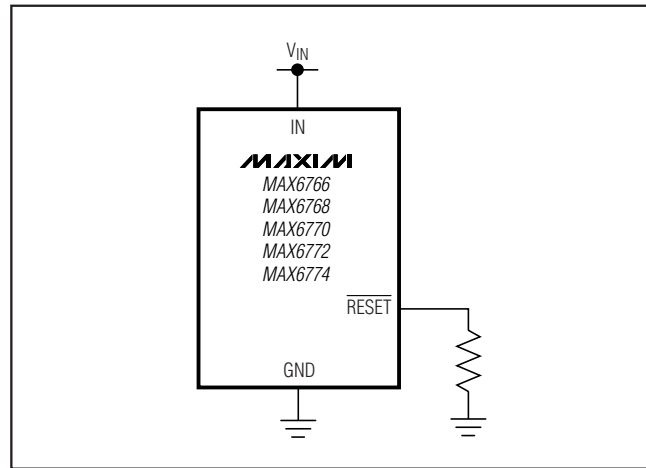

Figure 5. Ensuring  $\overline{\text{RESET}}$  Valid to  $V_{\text{IN}} = 0\text{V}$

### NOTES:

1. ALL DIMENSIONS ARE IN mm. ANGLES IN DEGREES.
  2. COPLANARITY SHALL NOT EXCEED 0.08 mm.
  3. WARPAGE SHALL NOT EXCEED 0.10 mm.
  4. PACKAGE LENGTH/PACKAGE WIDTH ARE CONSIDERED AS SPECIAL CHARACTERISTIC(S).
  5. DRAWING CONFORMS TO JEDEC MO229, EXCEPT DIMENSIONS "D2" AND "E2", AND T1433-1 & T1433-2.
  6. "N" IS THE TOTAL NUMBER OF LEADS.
  7. NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.
-  MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
