## Fast Transient Response Low Voltage 500 mA LDO

The NCP176 is CMOS LDO regulator featuring 500 mA output current. The input voltage is as low as 1.4 V and the output voltage can be set from 0.7 V.

### Features

- Operating Input Voltage Range: 1.4 V to 5.5 V
- Output Voltage Range: 0.7 to 3.6 V (0.1 V steps)
- Quiescent Current typ. 60  $\mu$ A
- Low Dropout: 130 mV typ. at 500 mA,  $V_{OUT} = 2.5$  V
- High Output Voltage Accuracy  $\pm 0.8\%$  ( $V_{OUT} > 1.8$  V)
- Stable with Small 1  $\mu$ F Ceramic Capacitors
- Over-current Protection
- Built-in Soft Start Circuit to Suppress Inrush Current
- Thermal Shutdown Protection: 165°C
- With (NCP176A) and Without (NCP176B) Output Discharge Function
- Available in XDFN6 1.2 mm x 1.2 mm x 0.4 mm Package
- These are Pb-free Devices

### Typical Applications

- Battery Powered Equipment
- Portable Communication Equipment
- Cameras, Image Sensors and Camcorders

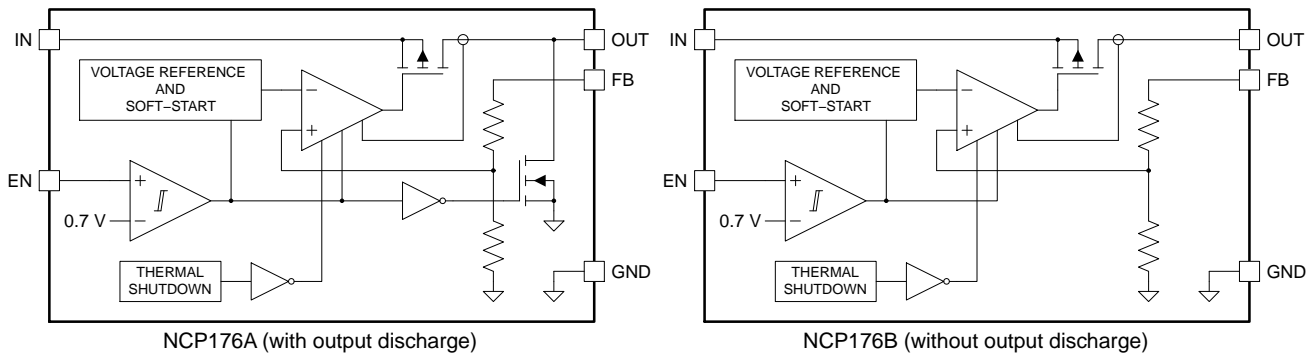

Figure 2. Internal Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin No. XDFN6	Pin Name	Description
1	OUT	LDO output pin
2	FB	Feedback input pin
3	GND	Ground pin
4	EN	Chip enable input pin (active "H")
5	N/C	Not internally connected. This pin can be tied to the ground plane to improve thermal dissipation.
6	IN	Power supply input pin
EPAD	EPAD	It is recommended to connect the EPAD to GND, but leaving it open is also acceptable

Table 2. ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	IN	-0.3 to 6.0	V
Output Voltage	OUT	-0.3 to $V_{IN} + 0.3$	V
Chip Enable Input	EN	-0.3 to 6.0	V
Output Current	$I_{OUT}$	Internally Limited	mA
Maximum Junction Temperature	$T_{J(MAX)}$	150	°C
Storage Temperature	$T_{STG}$	-55 to 150	°C
ESD Capability, Human Body Model (Note 2)	$ESD_{HBM}$	2000	V
ESD Capability, Machine Model (Note 2)	$ESD_{MM}$	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

## APPLICATIONS INFORMATION

**General**

The NCP176 is a high performance 500 mA low dropout linear regulator (LDO) delivering excellent noise and dynamic performance. Thanks to its adaptive ground current behavior the device consumes only 60  $\mu\text{A}$  of quiescent current (no-load condition).

The regulator features low noise of 48  $\mu\text{V}_{\text{RMS}}$ , PSRR of 75 dB at 1 kHz and very good line/load transient performance. Such excellent dynamic parameters, small dropout voltage and small package size make the device an ideal choice for powering the precision noise sensitive circuitry in portable applications.

A logic EN input provides ON/OFF control of the output voltage. When the EN is low the device consumes as low as 50 nA typ. from the IN pin.

The device is fully protected in case of output overload, output short circuit condition or overheating, assuring a very robust design.

**Input Capacitor Selection ( $C_{\text{IN}}$ )**

Input capacitor connected as close as possible is necessary to ensure device stability. The X7R or X5R capacitor should be used for reliable performance over temperature range. The value of the input capacitor should be 1  $\mu\text{F}$  or greater for the best dynamic performance. This capacitor will provide a low impedance path for unwanted AC signals or noise modulated onto the input voltage.

There is no requirement for the ESR of the input capacitor but it is recommended to use ceramic capacitor for its low ESR and ESL. A good input capacitor will limit the influence of input trace inductance and source resistance during load current changes.

**Output Capacitor Selection ( $C_{\text{OUT}}$ )**

The LDO requires an output capacitor connected as close as possible to the output and ground pins. The recommended capacitor value is 1  $\mu\text{F}$ , ceramic X7R or X5R type due to its low capacitance variations over the specified temperature range. The LDO is designed to remain stable with minimum effective capacitance of 0.8  $\mu\text{F}$ . When selecting the capacitor the changes with temperature, DC bias and package size needs to be taken into account. Especially for small package size capacitors such as 0201 the effective capacitance drops rapidly with the applied DC bias voltage (refer the capacitor's datasheet for details).

There is no requirement for the minimum value of equivalent series resistance (ESR) for the  $C_{\text{OUT}}$  but the maximum value of ESR should be less than 0.5  $\Omega$ . Larger capacitance and lower ESR improves the load transient response and high frequency PSRR. Only ceramic capacitors are recommended, the other types like tantalum capacitors not due to their large ESR.

**Enable Operation**

The LDO uses the EN pin to enable/disable its operation and to deactivate/activate the output discharge function (A-version only).

If the EN pin voltage is  $< 0.4\text{ V}$  the device is disabled and the pass transistor is turned off so there is no current flow between the IN and OUT pins. On A-version the active discharge transistor is active so the output voltage is pulled to GND through 60  $\Omega$  (typ.) resistor.

If the EN pin voltage is  $> 1.0\text{ V}$  the device is enabled and regulates the output voltage. The active discharge transistor is turned off.

The EN pin has internal pull-down current source with value of 150 nA typ. which assures the device is turned off when the EN pin is unconnected. In case when the EN function isn't required the EN pin should be tied directly to IN pin.

**Output Current Limit**

Output current is internally limited to a 750 mA typ. The LDO will source this current when the output voltage drops down from the nominal output voltage (test condition is  $V_{\text{OUT-NOM}} - 100\text{mV}$ ). If the output voltage is shorted to ground, the short circuit protection will limit the output current to 750 mA typ. The current limit and short circuit protection will work properly over the whole temperature and input voltage ranges. There is no limitation for the short circuit duration.

**Thermal Shutdown**

When the LDO's die temperature exceeds the thermal shutdown threshold value the device is internally disabled. The IC will remain in this state until the die temperature decreases by value called thermal shutdown hysteresis. Once the IC temperature falls this way the LDO is back enabled. The thermal shutdown feature provides the protection against overheating due to some application failure and it is not intended to be used as a normal working function.

**Power Dissipation**

Power dissipation caused by voltage drop across the LDO and by the output current flowing through the device needs to be dissipated out from the chip. The maximum power dissipation is dependent on the PCB layout, number of used Cu layers, Cu layers thickness and the ambient temperature. The maximum power dissipation can be computed by following equation:

$$P_{\text{D(MAX)}} = \frac{T_{\text{J}} - T_{\text{A}}}{\theta_{\text{JA}}} \text{ [W]} \quad (\text{eq. 1})$$

Where  $(T_{\text{J}} - T_{\text{A}})$  is the temperature difference between the junction and ambient temperatures and  $\theta_{\text{JA}}$  is the thermal resistance (dependent on the PCB as mentioned above).

## NCP176

The power dissipated by the LDO for given application conditions can be calculated by the next equation:

$$P_D = V_{IN} \cdot I_{GND} + (V_{IN} - V_{OUT}) \cdot I_{OUT} [W] \quad (\text{eq. 2})$$

Where  $I_{GND}$  is the LDO's ground current, dependent on the output load current.

Connecting the exposed pad and N/C pin to a large ground planes helps to dissipate the heat from the chip.

The relation of  $\theta_{JA}$  and  $P_{D(MAX)}$  to PCB copper area and Cu layer thickness could be seen on the Figure 30.

### Reverse Current

The PMOS pass transistor has an inherent body diode which will be forward biased in the case when  $V_{OUT} > V_{IN}$ . Due to this fact in cases, where the extended reverse current condition can be anticipated the device may require additional external protection.

### Power Supply Rejection Ratio

The LDO features very high power supply rejection ratio. The PSRR at higher frequencies (in the range above

100 kHz) can be tuned by the selection of  $C_{OUT}$  capacitor and proper PCB layout. A simple LC filter could be added to the LDO's IN pin for further PSRR improvement.

### Enable Turn-On Time

The enable turn-on time is defined as the time from EN assertion to the point in which  $V_{OUT}$  will reach 98% of its nominal value. This time is dependent on various application conditions such as  $V_{OUT-NOM}$ ,  $C_{OUT}$  and  $T_A$ .

### PCB Layout Recommendations

To obtain good transient performance and good regulation characteristics place  $C_{IN}$  and  $C_{OUT}$  capacitors as close as possible to the device pins and make the PCB traces wide. In order to minimize the solution size, use 0402 or 0201 capacitors size with appropriate effective capacitance.

Larger copper area connected to the pins will also improve the device thermal resistance. The actual power dissipation can be calculated from the equation above (Power Dissipation section). Exposed pad and N/C pin should be tied to the ground plane for good power dissipation.
