

PTN3460

eDP to LVDS bridge IC

Rev. 4 — 12 March 2014

Product data sheet

1. General description

PTN3460 is an (embedded) DisplayPort to LVDS bridge device that enables connectivity between an (embedded) DisplayPort (eDP) source and LVDS display panel. It processes the incoming DisplayPort (DP) stream, performs DP to LVDS protocol conversion and transmits processed stream in LVDS format.

PTN3460 has two high-speed ports: Receive port facing DP Source (for example, CPU/GPU/chip set), Transmit port facing the LVDS receiver (for example., LVDS display panel controller). The PTN3460 can receive DP stream at link rate 1.62 Gbit/s or 2.7 Gbit/s and it can support 1-lane or 2-lane DP operation. It interacts with DP source via DP Auxiliary (AUX) channel transactions for DP link training and setup.

It supports single bus or dual bus LVDS signaling with color depths of 18 bits per pixel or 24 bits per pixel and pixel clock frequency up to 112 MHz. The LVDS data packing can be done either in VESA or JEIDA format. Also, the DP AUX interface transports I²C-over-AUX commands and support EDID-DDC communication with LVDS panel. To support panels without EDID ROM, the PTN3460 can emulate EDID ROM behavior avoiding specific changes in system video BIOS.

PTN3460 provides high flexibility to optimally fit under different platform environments. It supports three configuration options: multi-level configuration pins, DP AUX interface, and I²C-bus interface.

PTN3460 can be powered by either 3.3 V supply only or dual supplies (3.3 V/1.8 V) and is available in the HVQFN56 7 mm × 7 mm package with 0.4 mm pitch.

2. Features and benefits

2.1 Device features

- Embedded microcontroller and on-chip Non-Volatile Memory (NVM) allow for flexibility in firmware updates
- LVDS panel power-up (/down) sequencing control
- Firmware controlled panel power-up (/down) sequence timing parameters
- No external timing reference needed
- EDID ROM emulation to support panels with no EDID ROM
 - ◆ Supports EDID structure v1.3
 - ◆ On-chip EDID emulation up to seven different EDID data structures
- eDP complying PWM signal generation or PWM signal pass through from eDP source

2.2 DisplayPort receiver features

- Compliant to DP v1.2 and v1.1a
- Compliant to eDP v1.2 and v1.1
- Supports Main Link operation with 1 or 2 lanes (default mode is 2-lane operation)
- Supports Main Link rate: Reduced Bit Rate (1.62 Gbit/s) and High Bit Rate (2.7 Gbit/s)
- Supports 1 Mbit/s AUX channel
 - ◆ Supports Native AUX and I²C-over-AUX transactions
- Supports down spreading to minimize EMI
- Integrated 50 Ω termination resistors provide impedance matching on both Main Link lanes and AUX channel
- High performance Auto Receive Equalization enabling optimal channel compensation, device placement flexibility and power saving at CPU/GPU
- Supports eDP authentication options: Alternate Scrambler Seed Reset (ASSR) and Alternate Framing
- Supports Fast Link training and Full Link training
- Supports DisplayPort symbol error rate measurements

2.3 LVDS transmitter features

- Compatible with ANSI/TIA/EIA-644-A-2001 standard
- Supports RGB data packing as per JEIDA and VESA data formats
- Supports pixel clock frequency from 25 MHz to 112 MHz
- Supports single LVDS bus operation up to 112 mega pixels per second
- Supports dual LVDS bus operation up to 224 mega pixels per second
- Supports color depth options: 18 bpp, 24 bpp
- Programmable center spreading of pixel clock frequency to minimize EMI
- Supports 1920 \times 1200 at 60 Hz resolution in dual LVDS bus mode
- Programmable LVDS signal swing to pre-compensate for channel attenuation or allow for power saving
- Supports PCB routing flexibility by programming for:
 - ◆ LVDS bus swapping
 - ◆ Channel swapping
 - ◆ Differential signal pair swapping
- Supports Data Enable polarity programming
- DDC control for EDID ROM access – I²C-bus interface up to 400 kbit/s

2.4 Control and system features

- Device programmability
 - ◆ Multi-level configuration pins enabling wider choice
 - ◆ I²C-bus slave interface supporting Standard-mode (100 kbit/s) and Fast-mode (400 kbit/s)
- Power management
 - ◆ Low-power state: DP AUX command-based Low-power mode (SET POWER)
 - ◆ Deep power-saving state via a dedicated pin

2.5 General

- Power supply: with on-chip regulator
 - ◆ 3.3 V ± 10 % (integrated regulator switched on)
 - ◆ 3.3 V ± 10 %, 1.8 V ± 5 % (integrated regulator switched off)
- ESD: 8 kV HBM, 1 kV CDM
- Operating temperature range: 0 °C to 70 °C
- HVQFN56 package 7 mm × 7 mm, 0.4 mm pitch; exposed center pad for thermal relief and electrical ground

3. Applications

- AIO platforms
- Notebook platforms
- Netbooks/net tops

4. System context diagram

Figure 1 illustrates the PTN3460 usage.

Fig 1. PTN3460 context diagram

5. Ordering information

Table 1. Ordering information

Type number	Topside mark	Package		
		Name	Description	Version
PTN3460BS/Fx ^{[1][2]}	PTN3460BS ^[3]	HVQFN56	plastic thermal enhanced very thin quad flat package; no leads; 56 terminals; body 7 × 7 × 0.85 mm ^[4] ; 0.4 mm pitch	SOT949-2

- [1] PTN3460BS/Fx is firmware-specific, where the 'x' indicates the firmware version.
- [2] Notes on firmware and marking:
 - a) Firmware versions are not necessarily backwards compatible.
 - b) Box/reel labels will indicate the firmware version via the orderable part number (for example, labeling will indicate PTN3460BS/F1 for firmware version 1). A sample label is illustrated in Figure 8.
- [3] Topside marking is limited to PTN3460BS and will not indicate the firmware version.
- [4] Maximum package height is 1 mm.

6. Block diagram

Fig 2. Block diagram of PTN3460

7. Pinning information

7.1 Pinning

Refer to [Section 13 “Package outline”](#) for package and pin dimensions.

7.2 Pin description

Table 2. Pin description

Symbol	Pin	Type	Description
DisplayPort interface signals			
DP0_P	4	self-biasing differential input	Differential signal from DP source. DP0_P makes a differential pair with DP0_N. The input to this pin must be AC-coupled externally.
DP0_N	5	self-biasing differential input	Differential signal from DP source. DP0_N makes a differential pair with DP0_P. The input to this pin must be AC-coupled externally.
DP1_P	7	self-biasing differential input	Differential signal from DP source. DP1_P makes a differential pair with DP1_N. The input to this pin must be AC-coupled externally.
DP1_N	8	self-biasing differential input	Differential signal from DP source. DP1_N makes a differential pair with DP1_P. The input to this pin must be AC-coupled externally.
AUX_P	2	self-biasing differential I/O	Differential signal towards DP source. AUX_P makes a differential pair with AUX_N. The pin must be AC-coupled externally.
AUX_N	1	self-biasing differential I/O	Differential signal towards DP source. AUX_N makes a differential pair with AUX_P. The pin must be AC-coupled externally.
HPDRX	11	single-ended 3.3 V CMOS output	Hot Plug Detect signal to DP source.
LVDS interface signals			
LVSAE_P	41	LVDS output	Even bus, Channel A differential signal to LVDS receiver. LVSAE_P makes a differential pair with LVSAE_N.
LVSAE_N	42	LVDS output	Even bus, Channel A differential signal to LVDS receiver. LVSAE_N makes a differential pair with LVSAE_P.
LVSBE_P	39	LVDS output	Even bus, Channel B differential signal to LVDS receiver. LVSBE_P makes a differential pair with LVSBE_N.
LVSBE_N	40	LVDS output	Even bus, Channel B differential signal to LVDS receiver. LVSBE_N makes a differential pair with LVSBE_P.
LVSCE_P	36	LVDS output	Even bus, Channel C differential signal to LVDS receiver. LVSCE_P makes a differential pair with LVSCE_N.
LVSCE_N	37	LVDS output	Even bus, Channel C differential signal to LVDS receiver. LVSCE_N makes a differential pair with LVSCE_P.
LVSCKE_P	34	LVDS clock output	Even bus, clock differential signal to LVDS receiver. LVSCKE_P makes a differential pair with LVSCKE_N.
LVSCKE_N	35	LVDS clock output	Even bus, clock differential signal to LVDS receiver. LVSCKE_N makes a differential pair with LVSCKE_P.
LVSDE_P	31	LVDS output	Even bus, Channel D differential signal to LVDS receiver. LVSDE_P makes a differential pair with LVSDE_N.
LVSDE_N	32	LVDS output	Even bus, Channel D differential signal to LVDS receiver. LVSDE_N makes a differential pair with LVSDE_P.
LVSAO_P	53	LVDS output	Odd bus, Channel A differential signal to LVDS receiver. LVSAO_P makes a differential pair with LVSAO_N.
LVSAO_N	54	LVDS output	Odd bus, Channel A differential signal to LVDS receiver. LVSAO_N makes a differential pair with LVSAO_P.
LVSBO_P	51	LVDS output	Odd bus, Channel B differential signal to LVDS receiver. LVSBO_P makes a differential pair with LVSBO_N.
LVSBO_N	52	LVDS output	Odd bus, Channel B differential signal to LVDS receiver. LVSBO_N makes a differential pair with LVSBO_P.

Table 2. Pin description ...continued

Symbol	Pin	Type	Description
LVSCO_P	48	LVDS output	Odd bus, Channel C differential signal to LVDS receiver. LVSCO_P makes a differential pair with LVSCO_N.
LVSCO_N	49	LVDS output	Odd bus, Channel C differential signal to LVDS receiver. LVSCO_N makes a differential pair with LVSCO_P.
LVSCKO_P	46	LVDS clock output	Odd bus, clock differential signal to LVDS receiver. LVSCKO_P makes a differential pair with LVSCKO_N.
LVSCKO_N	47	LVDS clock output	Odd bus, clock differential signal to LVDS receiver. LVSCKO_N makes a differential pair with LVSCKO_P.
LVSDO_P	43	LVDS output	Odd bus, Channel D differential signal to LVDS receiver. LVSDO_P makes a differential pair with LVSDO_N.
LVSDO_N	44	LVDS output	Odd bus, Channel D differential signal to LVDS receiver. LVSDO_N makes a differential pair with LVSDO_P.
DDC_SDA	30	open-drain DDC data I/O	DDC data signal connection to display panel. Pulled-up by external termination resistor (5 V tolerant).
DDC_SCL	29	open-drain DDC clock I/O	DDC clock signal connection to display panel. Pulled-up by external termination resistor (5 V tolerant).
Panel and backlight interface signals			
PVCCEN	33	CMOS output	Panel power (V_{CC}) enable output.
PWMO	28	CMOS output	PWM output signal to display panel.
BKLTEN	26	CMOS output	Backlight enable output.
Control interface signals			
PD_N	10	CMOS input	Chip power-down input (active LOW). If PD_N is LOW, then the device is in Deep power-down completely, even if supply rail is ON; for the device to be able to operate, the PD_N pin must be HIGH.
RST_N	9	CMOS input	Chip reset pin (active LOW); internally pulled-up. The pin is meant to reset the device and all its internal states/logic; all internal registers are taken to default value after RST_N is applied and made HIGH. If RST_N is LOW, the device stays in reset condition and for the device to be able to operate, RST_N must be HIGH.
DEV_CFG	12	CMOS I/O	I ² C-bus address/mode selection pin.
TESTMODE	20	CMOS input	If TESTMODE is left open or pulled HIGH, CFG[4:1] operate as JTAG pins. If TESTMODE is pulled LOW, these pins serve as configuration pins.
CFG1	21	input	Behavior defined by TESTMODE pin. If TESTMODE is left open or pulled HIGH, this pin functions as JTAG TEST CLOCK input. If TESTMODE is pulled LOW, this pin acts as configuration input.
CFG2	22	input	Behavior defined by TESTMODE pin. If TESTMODE is left open or pulled HIGH, this pin functions as JTAG MODE SELECT input. If TESTMODE is pulled LOW, this pin acts as configuration input.
CFG3	23	input	Behavior defined by TESTMODE pin. If TESTMODE is left open or pulled HIGH, this pin functions as JTAG TEST DATA INPUT. If TESTMODE is pulled LOW, this pin acts as configuration input.
CFG4	27	I/O	Behavior defined by TESTMODE pin value. If TESTMODE is left open or pulled HIGH, this pin functions as JTAG TEST DATA OUTPUT. If TESTMODE is pulled LOW, this pin acts as configuration input.

Table 2. Pin description ...continued

Symbol	Pin	Type	Description
MS_SDA	24	open-drain (I ² C) data input/output	I ² C-bus data signal connection to I ² C-bus master or slave. Pulled up by external resistor.
MS_SCL	25	open-drain (I ² C) clock input/output	I ² C-bus clock signal connection to I ² C-bus master or slave. Pulled up by external resistor.
n.c.	55	-	not connected; reserved.
EPS_N	56	input	Can be left open or pulled HIGH for 3.3 V supply only option relying on internal regulator for 1.8 V generation. Should be pulled down to GND for dual supply (3.3 V/1.8 V) option.
Supply, ground and decoupling			
V _{DD(3V3)}	13, 14, 38, 50	power	3.3 V supply input.
V _{DD(1V8)}	6, 45	power	1.8 V supply input.
V _{DD(1V8)}	19	power	1.8 V regulator supply output.
n.c.	15, 16	power	Not connected.
GND	3	power	Ground.
GNDREG	17, 18	power	Ground for regulator.
GND	center pad	power	The center pad must be connected to motherboard GND plane for both electrical ground and thermal relief.

8. Functional description

PTN3460 is an (Embedded) DisplayPort to LVDS bridge IC that processes the incoming DisplayPort (DP) stream, performs DP to LVDS protocol conversion and transmits processed stream in LVDS format. Refer to [Figure 2 “Block diagram of PTN3460”](#).

The PTN3460 consists of:

- DisplayPort receiver
- LVDS transmitter
- System control and operation

The following sections describe individual sub-systems and their capabilities in more detail.

8.1 DisplayPort receiver

PTN3460 implements a DisplayPort receiver consisting of 2-lane Main Link and AUX channel.

With its advanced signal processing capability, it can handle Fast Link training or Full Link training scheme. PTN3460 implements a high-performance Auto Receive Equalizer and Clock Data Recovery (CDR) algorithm, with which it identifies and selects an optimal operational setting for given channel environment. Given that the device is targeted primarily for embedded Display connectivity, both Display Authentication and Copy Protection Method 3a (Alternate Scrambler Seed Reset) and Method 3b (Enhanced Framing) are supported, as per *eDP 1.2*.

The PTN3460 DPCD registers can be accessed by DP source through AUX channel. It supports both Native AUX transactions and I²C-over-AUX transactions.

Native AUX transactions are used to access PTN3460 DisplayPort Configuration Data (DPCD) registers (e.g., to facilitate Link training, check error conditions, etc.) and I²C-over-AUX transactions are used to perform any required access to DDC bus (e.g., EDID reads).

Given that the HPDRX pin is internally connected to GND through an integrated pull-down resistor (> 100 kΩ), the DP source will see HPDRX pin as LOW indicating that the DisplayPort receiver is not ready when the device is not powered. This helps avoid raising false events to the source. After power-up, PTN3460 continues to drive HPDRX pin LOW until completion of internal initialization. After this, PTN3460 generates HPD signal to notify DP source and take corrective action(s).

8.1.1 DP Link

PTN3460 is capable of operating either in DP 2-lane or 1-lane mode. The default is 2-lane mode of operation (in alignment with PTN3460 DCPD register 00002h, MAX_LANE_COUNT = 2).

There are two ways to enable 1-lane operation in an application:

- Connect both DP lanes of PTN3460 to the DP source. This enables the DP source to decide/use only required number of lanes based on display resolution.
- Connect only 1 lane (DP0_P, DP0_N) to DP source and modify the DPCD register 00002h, MAX_LANE_COUNT to '1' through NXP I²C configuration utility to modify the internal configuration table. Please consult NXP for more details regarding the Flash-over-AUX and DOS utilities.

8.1.2 DPCD registers

DPCD registers are described in VESA DisplayPort v1.1a/1.2 specifications in detail and PTN3460 supports DPCD version 1.2.

PTN3460 configuration registers can be accessed through DP AUX channel from the GPU/CPU, if required. They are defined under vendor-specific region starting at base address 0x00510h. So any configuration register can be accessed at DPCD address obtained by adding the register offset and base address.

PTN3460 supports down spreading on DP link and this is reflected in DPCD register MAX_DOWNSPREAD at address 0003h. Further, the DP source could control down spreading and inform PTN3460 via DOWNSPREAD_CTRL register at DPCD register 00107h.

The key aspect is that the system designer must take care that the Input video payload fits well within both DP link bandwidth and LVDS bandwidth (for a given pixel frequency, SSC depths) when clock spreading is enabled. Also, another aspect for the system designer is to ensure LVDS (panel) TCONs are capable of handling SSC modulated LVDS signaling.

8.2 LVDS transmitter

The LVDS interface can operate either in Single or Dual LVDS Bus mode at pixel clock frequencies over the range of 25 MHz to 112 MHz and color depths of 18 bpp or 24 bpp. Each LVDS bus consists of 3/4 differential data pairs and one clock pair. PTN3460 can packetize RGB video data, HSYNC, VSYNC, DE either in VESA or JEIDA format. To enable system EMI reduction, the device can be programmed for center spreading of LVDS channel clock outputs.

The LVDS interface can be flexibly configured using multi-level configuration pins (CFG1, CFG2, CFG3, CFG4) or via register interface. The configuration pins and the corresponding definitions are described in [Table 3](#) through [Table 6](#). Nevertheless, as the configuration pins are designed for general purpose, their definitions can be modified and they can be used for any other purposes. However, this can be achieved through firmware upgrade only.

Table 3. CFG1 configuration options

Configuration input setting	Number of LVDS links
LOW	single LVDS bus
HIGH	dual LVDS bus

Table 4. CFG2 configuration options

3-level configuration input setting	Data format	Number of bits per pixel (bpp)
LOW	VESA	24 bpp
open	JEIDA	24 bpp
HIGH	JEIDA or VESA	18 bpp

Table 5. CFG3 configuration options^[1]

3-level configuration input setting	LVDS clock frequency spread depth control
LOW	0 %
open	1 %
HIGH	0.5 %

[1] LVDS center spreading modulation frequency is kept at 32.9 kHz.

Table 6. CFG4 configuration options

3-level configuration input setting	LVDS output swing (typical value)
pull-down resistor ^[1] to GND	250 mV
open	300 mV
pull-up resistor ^[1] to $V_{DD(3V3)}$	400 mV

[1] Pull-up/down resistor value in the range of 1 k Ω to 10 k Ω .

The VESA and JEIDA data format definitions are described in [Table 7](#) to [Table 13](#).

Table 7. LVDS single bus, 18 bpp, VESA or JEIDA data packing

Channel	Bit position						
	6	5	4	3	2	1	0
LVDS odd differential channel A	bit 0	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
LVDS odd differential channel B	bit 1	bit 0	bit 5	bit 4	bit 3	bit 2	bit 1

PTN3460 delivers great flexibility by supporting more programmable options via I²C-bus or AUX interface. Please refer to [Section 8.3.8](#) for more details.

8.3 System control and operation

With its combination of embedded microcontroller, non-volatile memory, DPCD AUX and I²C-bus interfaces, PTN3460 delivers significant value for customer applications by providing higher degree of control and programmability.

By default, all user controllable registers can be accessed through DPCD AUX interface. This interface is always enabled. This AUX interface delivers seamless access of PTN3460 registers to system/platform (GPU) firmware driver. Nevertheless, use of I²C-bus interface for configuring PTN3460 is left to the choice of system integrator.

DEV_CFG (pin 12) sets up I²C-bus configuration mode:

- Pull-down resistor to GND — PTN3460 operates as I²C-bus slave, low address (0x40h)
- Open — PTN3460 operates as I²C-bus slave, high address (0xC0h)
- Pull-up resistor to V_{DD(3V3)} — PTN3460 operates as I²C-bus master capable of reading from external EEPROM

8.3.1 Reset, power-down and power-on initialization

The device has a built-in reset circuitry that generates internal reset signal after power-on. All the internal registers and state machines are initialized and the registers take default values. In addition, PTN3460 has a dedicated control pin RST_N. This serves the same purpose as power-on reset, but without power cycling of the device/platform.

PTN3460 starts up in a default condition after power-on or after RST_N is toggled from LOW to HIGH. The configuration pins are sampled at power-on, or external reset, or when returning from Deep Sleep.

PTN3460 goes into Deep power-saving when PD_N is LOW. This will trigger a power-down sequence. To leave Deep power-saving state, the system needs to drive PD_N back to HIGH. If PD_N pin is open, the device will not enter Deep power-saving state. Once the device is in Deep power-saving condition, the HPDRX pin will go LOW automatically and this can be used by the system to remove the 3.3 V supply, if required.

Remark: The device will not respect the Panel power-down sequence if PD_N is asserted LOW while video is being streamed to the display. So the system is not supposed to toggle PD_N and RST_N pins asynchronously while the LVDS output is streaming video to the display panel, but instead follow the panel powering sequence as described in [Section 8.3.3](#).

8.3.2 LVDS panel control

PTN3460 implements eDPv1.2 specific DPCD registers that concern panel power, backlight and PWM controls and the DP source can issue AUX commands to initiate panel power-up/down sequence as required. Also, PTN3460 supports LVDS panel control pins — backlight enable, panel power enable and PWM — that can be set via AUX commands.

- **PVCCEN pin** — the signal output is set based on SET_POWER DPCD register 00600h and SET_POWER_CAPABLE bit of EDP_GENERAL_CAPABILITY_REGISTER_1 DPCD register 00701h and detection and handling of video data stream by PTN3460
- **BKLTEN pin** — the signal output is set based on BACKLIGHT_PIN_ENABLE_CAPABLE bit of EDP_GENERAL_CAPABILITY_REGISTER_1 DPCD register 00701h and BACKLIGHT_ENABLE bit of EDP_DISPLAY_CONTROL_REGISTER DPCD register 00720h
- **PWMO pin** — the PWM signal generated by PTN3460 based on controls set in DPCD registers. In addition, PTN3460 can pass through PWM signal from eDP source as well. Please refer to [Ref. 2](#) for more information.

All the panel control enable and signal outputs from PTN3460 are aligned with panel power-on sequence timing including LVDS video output generation. It is important to note that the Panel power must be delivered by the system platform and it should be gated by PVCCEN signal.

8.3.3 Panel power sequencing

Figure 4 illustrates an example of panel power-up/power-down sequence for PTN3460.

Depending on the source behavior and PTN3460 firmware version, the powering sequence/timing could have some slight differences.

Fig 4. Panel power-up/power-down sequence example

When working with eDP capable DP sources, PTN3460 supports the following (for specific sequence, refer to Figure 4):

- After power-on/startup, HPDRX is asserted HIGH, DP source will start AUX communication for initialization, perform Link Training and starts the video data stream. Once presence of video data is detected, PTN3460 will assert PVCCEN to HIGH, synchronize to video stream, output LVDS data and assert rise the Sink_status lock as indicated in DPCD register (0x00205h). PTN3460 will wait for Backlight enabling delay (T3) to avoid visual artifacts and program the BKLTEN HIGH.
- While transitioning out of Active state by receiving DPCD 0x600 to set PTN3460 in D3 mode, PTN3460 will disable BKLTEN prior to cutting off Video streaming to avoid visible artifacts following specific panel specifications. PTN3460 will assert PVCCEN to LOW after T5 delay as long as either if the video stream is stopped or video synchronization is lost. This is to avoid driving the LVDS panel with illegal stream for long periods of time. It is good practice for sources to keep video data or at least DP-idle stream active during T4 + T5.
- When PTN3460 is in Low-power state (DisplayPort D3 power state), the LVDS differential I/Os are weakly pulled down to 0 V. In this state, PVCCEN and BKLTEN are pulled LOW.
- When PD_N is LOW, which sets PTN3460 in Deep power-saving state, the BKLTEN pin is set to LOW. LVDS differential I/Os are pulled LOW via the weak pull-downs.

8.3.4 Termination resistors

The device provides integrated and calibrated 50 Ω termination resistors on both DisplayPort Main Link lanes and AUX channel.

8.3.5 Reference clock input

PTN3460 does not require an external clock. It relies fully on the clock derived internally from incoming DP stream or on-chip clock generator.

8.3.6 Power supply

PTN3460 can be flexibly supplied with either 3.3 V supply only or dual supplies (3.3 V/1.8 V). When supplied with 3.3 V supply only, the integrated regulator is used to generate 1.8 V for internal circuit operation. In this case, the EPS_N pin must be pulled HIGH or left open. For optimal power consumption, dual supply option (3.3 V and 1.8 V) is recommended.

8.3.7 Power management

In tune with the system application needs, PTN3460 implements aggressive techniques to support system power management and conservation. The device can exist in one of the three different states as described below:

- **Active state** when the device is fully operational.
- **Low-power state** when DP source issues AUX SET_POWER command on DPCD register 00600h. In this state, AUX and HPD circuits are operational but the main DP Link and LVDS Bus are put to high-impedance condition. The device will transition back to Active state when the DP source sets the corresponding DPCD register bits to 'DisplayPort D0/Normal Operation mode'. The I²C-bus interface will not be operational in this state.
- **Deep power-saving state:** In this state PTN3460 is put to ultra low-power condition. This is effected when PD_N is LOW. To get back to Active state, PD_N must be made HIGH. The external interfaces (like I²C, AUX, DP, LVDS, configuration pins) will not be operational.

8.3.8 Register interface — control and programmability

PTN3460 has a register interface that can be accessed by CPU/GPU or System Controller to choose settings suitably for the System application needs. The registers can be read/written either via DP AUX or I²C-bus interface. It is left to system integrator choice to use an interface to configure PTN3460.

PTN3460 provides greater level of configurability of certain parameters (e.g., LVDS output swing, spreading depth, etc.) via registers beyond what is available through pins. The register settings override the pin values. All registers must be configured during power-on initialization after HPDRX is HIGH. The registers and bit definitions are described in "*I²C-bus utility and programming guide for firmware and EDID update*" ([Ref. 3](#)).

8.3.9 EDID handling

The DP source issues EDID reads using I²C-over-AUX transactions and PTN3460, in turn, reads from the panel EDID ROM and passes back to the source. To support seamless functioning of panels without EDID ROM, the PTN3460 can be programmed to emulate EDID ROM and delivers internally stored EDID information to the source. Given

that EDID is specific to panels, PTN3460 enables system integrator to program EDID information into embedded memory through DP AUX and I²C-bus interfaces. The supported EDID ROM emulation size is 896 bytes (seven EDID data structures, each of 128 bytes).

9. Application design-in information

[Figure 5](#) illustrates PTN3460 usage in a system context. The eDP inputs are connected to DP source port on CPU/GPU and the LVDS outputs are connected to LVDS panel TCON.

11. Recommended operating conditions

Table 15. Operating conditions

Over operating free-air temperature range, unless otherwise noted.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V _{DD(3V3)}	supply voltage (3.3 V)		3.0	3.3	3.6	V
V _{DD(1V8)}	supply voltage (1.8 V)		1.7	1.8	1.9	V
V _I	input voltage	3.3 V CMOS inputs	0	3.3	3.6	V
		open-drain I/O with respect to ground (e.g., DDC_SCL, DDC_SDA, MS_SDA, MS_SCL)	0	5	5.5	V
T _{amb}	ambient temperature	operating in free air	0	-	70	°C

12. Characteristics

12.1 Device characteristics

Table 16. Device characteristics

Over operating free-air temperature range, unless otherwise noted.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t _{startup}	start-up time	device start-up time from power-on and RST_N = HIGH; supply voltage within operating range to specified operating characteristics	-	-	90	ms
t _{w(rst)}	reset pulse width	device is supplied with valid supply voltage	10	-	-	μs
t _{d(rst)}	reset delay time ^[1]	device is supplied with valid supply voltage	-	-	90	ms
t _{d(pwrsave-act)}	delay time from power-save to active	time between PD_N going HIGH and HPD raised HIGH by PTN3460; RST_N is HIGH. Device is supplied with valid supply voltage.	-	-	90	ms

[1] Time for device to be ready after rising edge of RST_N.

12.2 Power consumption

Table 17. Power consumption

At operating free-air temperature of 25 °C and under nominal supply value (unless otherwise noted).

Symbol	Parameter	Conditions	Single supply mode EPS_N = HIGH or open			Dual supply mode EPS_N = LOW			Unit
			Min	Typ	Max	Min	Typ	Max	
P _{cons}	power consumption	Active mode; 1440 × 900 at 60 Hz; 24 bits per pixel; dual LVDS bus ^[1]	-	430	-	-	290	-	mW
		Active mode; 1600 × 900 at 60 Hz; 24 bits per pixel; dual LVDS bus ^[1]	-	448	-	-	305	-	mW
		Active mode; 1920 × 1200 at 60 Hz; 24-bits per pixel; dual LVDS bus ^[1]	-	570	-	-	380	-	mW
		D3 mode/Power-saving mode; when PTN3460 is set to Power-saving mode via 'SET_POWER' AUX command by eDP source; AUX and HPDRX circuitry are only kept active	-	27	-	-	15	-	mW
		Deep power-saving/Shutdown mode; when PD_N is LOW and the device is supplied with valid supply voltage	-	5	-	-	2	-	mW

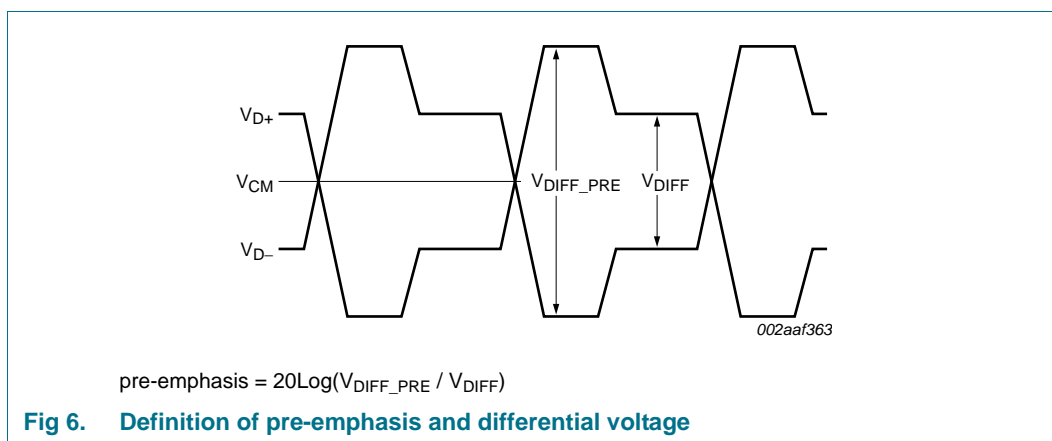

[1] For Active mode power consumption, LVDS output swing of 300 mV is considered.

12.3 DisplayPort receiver characteristics

Table 18. DisplayPort receiver main channel characteristics
Over operating free-air temperature range (unless otherwise noted).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
UI	unit interval	high bit rate (2.7 Gbit/s per lane) [1]	-	370	-	ps
		reduced bit rate (1.62 Gbit/s per lane) [1]	-	617	-	ps
$\Delta f_{\text{DOWN_SPREAD}}$	link clock down spreading	[2]	0	-	0.5	%
C_{RX}	AC coupling capacitor		75	-	200	nF
$V_{\text{RX_DIFFp-p}}$	differential input peak-to-peak voltage	at receiver package pins				
		high bit rate (2.7 Gbit/s per lane) [3]	120	-	-	mV
		reduced bit rate (1.62 Gbit/s per lane) [3]	40	-	-	mV
$V_{\text{RX_DC_CM}}$	RX DC common mode voltage	[4]	0	-	2.0	V
$I_{\text{RX_SHORT}}$	RX short-circuit current limit	[5]	-	-	50	mA
$f_{\text{RX_TRACKING_BW}}$	jitter tracking bandwidth	[6]	20	-	-	MHz
$G_{\text{eq(max)}}$	maximum equalization gain	at 1.35 GHz	-	15	-	dB

- [1] Range is nominal ± 350 ppm. DisplayPort channel RX does not require local crystal for channel clock generation.
- [2] Up to 0.5 % down spreading is supported. Modulation frequency range of 30 kHz to 33 kHz is supported.
- [3] Informative; refer to [Figure 6](#) for definition of differential voltage.
- [4] Common-mode voltage is equal to $V_{\text{bias_RX}}$ voltage.
- [5] Total drive current of the input bias circuit when it is shorted to its ground.
- [6] Minimum CDR tracking bandwidth at the receiver when the input is repetition of D10.2 symbols without scrambling.

12.4 DisplayPort AUX characteristics

Table 19. DisplayPort AUX characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
UI	unit interval		[1] 0.4	0.5	0.6	μs
t _{jit(cc)}	cycle-to-cycle jitter time	transmitting device	[2] -	-	0.04	UI
		receiving device	[3] -	-	0.05	UI
V _{AUX_DIFFp-p}	AUX differential peak-to-peak voltage	transmitting device	[4] 0.39	-	1.38	V
		receiving device	[4] 0.32	-	1.36	V
R _{AUX_TERM(DC)}	AUX CH termination DC resistance	informative	-	100	-	Ω
V _{AUX_DC_CM}	AUX DC common-mode voltage		[5] 0	-	2.0	V
V _{AUX_TURN_CM}	AUX turnaround common-mode voltage		[6] -	-	0.3	V
I _{AUX_SHORT}	AUX short-circuit current limit		[7] -	-	90	mA
C _{AUX}	AUX AC coupling capacitor		[8] 75	-	200	nF

- [1] Results in the bit rate of 1 Mbit/s including the overhead of Manchester II coding.
- [2] Maximum allowable UI variation within a single transaction at connector pins of a transmitting device. Equal to 24 ns maximum. The transmitting device is a source device for a request transaction and a sink device for a reply transaction.
- [3] Maximum allowable UI variation within a single transaction at connector pins of a receiving device. Equal to 30 ns maximum. The transmitting device is a source device for a request transaction and a sink device for a reply transaction.
- [4] $V_{AUX_DIFFp-p} = 2 \times |V_{AUX_P} - V_{AUX_N}|$.
- [5] Common-mode voltage is equal to V_{bias_TX} (or V_{bias_RX}) voltage.
- [6] Steady-state common-mode voltage shift between transmit and receive modes of operation.
- [7] Total drive current of the transmitter when it is shorted to its ground.
- [8] The AUX channel AC-coupling capacitor placed both on the DisplayPort source and sink devices.

12.5 LVDS interface characteristics

Table 20. LVDS interface characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{o(dif)(p-p)}$	peak-to-peak differential output voltage	$R_L = 100 \Omega$; CFG4 pin is open and LVDS interface control 2 register in default value	250	300	350	mV
$\Delta V_{o(dif)}$	differential output voltage variation	$R_L = 100 \Omega$; change in differential output voltage between complementary output states	-	-	50	mV
V_{cm}	common-mode voltage	$R_L = 100 \Omega$	1.125	1.2	1.375	V
I_{OS}	output short-circuit current	$R_L = 100 \Omega$	-	-	24	mA
I_{OZ}	OFF-state output current	output 3-state circuit current; $R_L = 100 \Omega$; LVDS outputs are 3-stated; receiver biasing at 1.2 V	-	-	20	μ A
t_r	rise time	$R_L = 100 \Omega$; from 20 % to 80 %	-	-	390	ps
t_f	fall time	$R_L = 100 \Omega$; from 80 % to 20 %	-	-	390	ps
t_{sk}	skew time	intra-pair skew between differential pairs	-	-	50	ps
		inter-pair skew between 2 adjacent LVDS channels	-	-	200	ps
m	modulation index	for center spreading				
		minimum modulation depth	-	0	-	%
		maximum modulation depth	-	2.5	-	%
f_{mod}	modulation frequency	center spreading	30	-	100	kHz

12.6 Control inputs and outputs

Table 21. Control input and output characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Signal output pins — PVCCEN, BKLTEN, HPDRX, PWMO						
V_{OH}	HIGH-level output voltage	$I_{OH} = -2$ mA	2.4	-	-	V
V_{OL}	LOW-level output voltage	$I_{OL} = 2$ mA	-	-	0.4	V
Control input pins — RST_N, PD_N, TESTMODE, DEV_CFG, CFG[4:1]						
V_{IH}	HIGH-level input voltage		$0.7V_{DD(3V3)}$	-	-	V
V_{IL}	LOW-level input voltage		-	-	$0.3V_{DD(3V3)}$	V
Control input pin — EPS_N						
V_{IH}	HIGH-level input voltage		$0.7V_{DD(3V3)}$	-	-	V
V_{IL}	LOW-level input voltage		-	-	$0.2V_{DD(3V3)}$	V
DDC_SDA, DDC_SCL, MS_SDA, MS_SCL[1]						
V_{IH}	HIGH-level input voltage		$0.7V_{DD(3V3)}$	-	5.25	V
V_{IL}	LOW-level input voltage		-	-	$0.3V_{DD(3V3)}$	V
I_{OL}	LOW-level output current	static output; $V_{OL} = 0.4$ V	3.0	-	-	mA

[1] For DDC_SCL, DDC_SDA, MS_SCL, MS_SDA characteristics, please refer to UM10204, “I²C-bus specification and user manual” (Ref. 11).

Figure 8 is an example of the label that would be placed on the product shipment box and the tape/reel.

Fig 8. Packing label example

15. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note AN10365 “Surface mount reflow soldering description”.

15.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

15.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

15.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

15.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 9](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 22](#) and [23](#)

Table 22. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm ³)	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

Table 23. Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm ³)		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 9](#).

For further information on temperature profiles, refer to Application Note AN10365 “Surface mount reflow soldering description”.

16. Abbreviations

Table 24. Abbreviations

Acronym	Description
AIO	All In One
AUX	Auxiliary channel
BIOS	Basic Input/Output System
bpp	bits per pixel
CDM	Charged-Device Model
CDR	Clock Data Recovery
CPU	Central Processing Unit
DDC	Data Display Channel
DP	DisplayPort
DPCD	DisplayPort Configuration Data
EDID	Extended Display Identification Data
eDP	embedded DisplayPort
EMI	ElectroMagnetic Interference
ESD	ElectroStatic Discharge
GPU	Graphics Processor Unit
HBM	Human Body Model
HBR	High Bit Rate (2.7 Gbit/s) of DisplayPort specification
HPD	Hot Plug Detect signal of DisplayPort or LVDS interface
I/O	Input/Output
I ² C-bus	Inter-Integrated Circuit bus
IC	Integrated Circuit
LVDS	Low-Voltage Differential Signaling
NVM	Non-Volatile Memory
PCB	Printed-Circuit Board
POR	Power-On Reset
PWM	Pulse Width Modulation (or Modulator)
RBR	Reduced Bit Rate (1.62 Gbit/s) of DisplayPort specification
RGB	Red/Green/Blue
ROM	Read-Only Memory
Rx	Receive
SSC	Spread Spectrum Clock
TCON	Timing CONTroller
Tx	Transmit
UI	Unit Interval
VESA	Video Electronics Standards Association

19. Legal information

19.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

19.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

19.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

19.4 Trademarks

Notice: All referenced brands, product names, service names and trademarks are the property of their respective owners.

21. Contents

1	General description	1	15.2	Wave and reflow soldering	26
2	Features and benefits	1	15.3	Wave soldering	26
2.1	Device features	1	15.4	Reflow soldering	26
2.2	DisplayPort receiver features	2	16	Abbreviations	28
2.3	LVDS transmitter features	2	17	References	29
2.4	Control and system features	2	18	Revision history	29
2.5	General	3	19	Legal information	30
3	Applications	3	19.1	Data sheet status	30
4	System context diagram	3	19.2	Definitions	30
5	Ordering information	3	19.3	Disclaimers	30
6	Block diagram	4	19.4	Trademarks	31
7	Pinning information	5	20	Contact information	31
7.1	Pinning	5	21	Contents	32
7.2	Pin description	6			
8	Functional description	8			
8.1	DisplayPort receiver	8			
8.1.1	DP Link	9			
8.1.2	DPCD registers	9			
8.2	LVDS transmitter	10			
8.3	System control and operation	13			
8.3.1	Reset, power-down and power-on initialization	13			
8.3.2	LVDS panel control	14			
8.3.3	Panel power sequencing	15			
8.3.4	Termination resistors	16			
8.3.5	Reference clock input	16			
8.3.6	Power supply	16			
8.3.7	Power management	16			
8.3.8	Register interface — control and programmability	16			
8.3.9	EDID handling	16			
9	Application design-in information	17			
10	Limiting values	19			
11	Recommended operating conditions	19			
12	Characteristics	20			
12.1	Device characteristics	20			
12.2	Power consumption	20			
12.3	DisplayPort receiver characteristics	21			
12.4	DisplayPort AUX characteristics	22			
12.5	LVDS interface characteristics	23			
12.6	Control inputs and outputs	23			
13	Package outline	24			
14	Packing information	25			
15	Soldering of SMD packages	25			
15.1	Introduction to soldering	25
