### General Description

The SY89832U is a 2.5V, high-speed, 2 GHz differential, low voltage differential swing (LVDS) 1:4 fanout buffer optimized for ultra-low skew applications. Within device skew is guaranteed to be less than 20 ps over supply voltage and temperature.

The differential input buffer has a unique internal termination design that allows access to the termination network through a V<sub>T</sub> pin. This feature allows the device to easily interface to different logic standards. A VREF-AC reference output is included for AC-coupled applications.

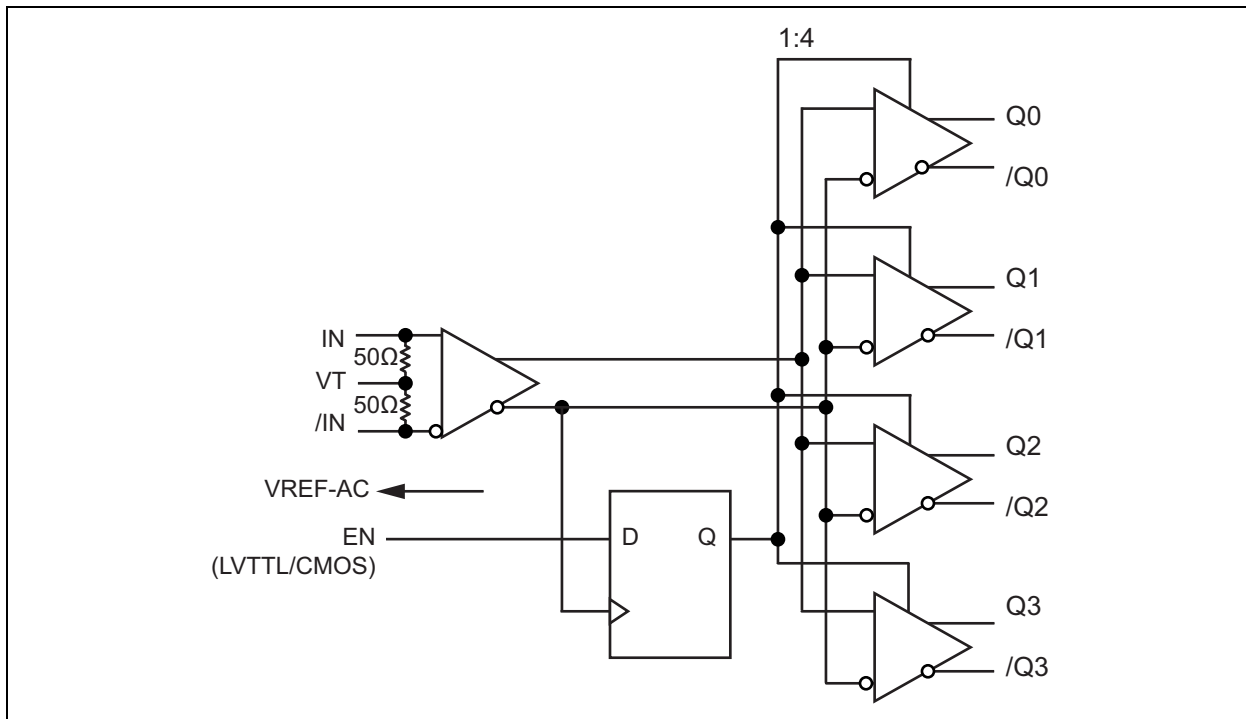

The SY89832U is a part of the high-speed clock synchronization family. For 3.3V applications, see SY89833L or SY89833AL.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin Number	Pin Name	Pin Function
15, 16 1, 2 3, 4 5, 6	Q0, /Q0 Q1, /Q1 Q2, /Q2 Q3, /Q3	LVDS Differential (Outputs): Normally terminated with 100Ω across the pair (Q, /Q). See <a href="#">LVDS Outputs</a> section for more details. Unused outputs should be terminated with a 100Ω resistor across each pair.
8	EN	The single-ended, TTL/CMOS-compatible input functions as a synchronous output enable. The synchronous enable ensures that enable/disable will only occur when the Q outputs are in a logic LOW state. Note that this input is internally connected to a 25 kΩ pull-up resistor and will default to logic HIGH state (enabled) if left open.
9, 12	/IN, IN	Differential Input: This input is the differential signal input to the device. Input accepts AC- or DC-Coupled differential signs as small as 100 mV. Each pin internally terminates to the V <sub>T</sub> pin through 50Ω. Note that this input will default to an intermediate state if left open. See <a href="#">Input Interface Applications</a> section for more details.
10	VREF-AC	Reference Voltage: This output biases to approximately V <sub>CC</sub> – 1.4V. It is used when AC coupling the input (IN, /IN). For AC-Coupled applications, connect VREF-AC to VT pin and bypass with a 0.01 μF low-ESR capacitor to VCC. See <a href="#">Input Interface Applications</a> section for more details. Maximum sink/source current is ±1.5 mA. Due to the limited drive capability, the VREF-AC pin is only intended to drive the VT pin.
11	VT	Input Termination Center-Tap: Each side of the differential input pair terminates to the VT pin. The VT pin provides a center-tap to a termination network for maximum interface flexibility. See <a href="#">Input Interface Applications</a> section for more details.
13	GND	Ground. GND pin and exposed pad must be connected to the most negative potential of the device ground.
7, 14	VCC	Positive Power Supply: Bypass with 0.1 μF//0.01 μF low ESR capacitors and place as close to each VCC pin as possible.

## 8.0 LVDS OUTPUTS

LVDS specifies a small swing of 325 mV typical, on a nominal 1.2V common-mode above ground.

The common-mode voltage has tight limits to permit large variations in ground noise between an LVDS driver and receiver.
