

## Proximity Switch

TCA 305  
TCA 355

Bipolar IC

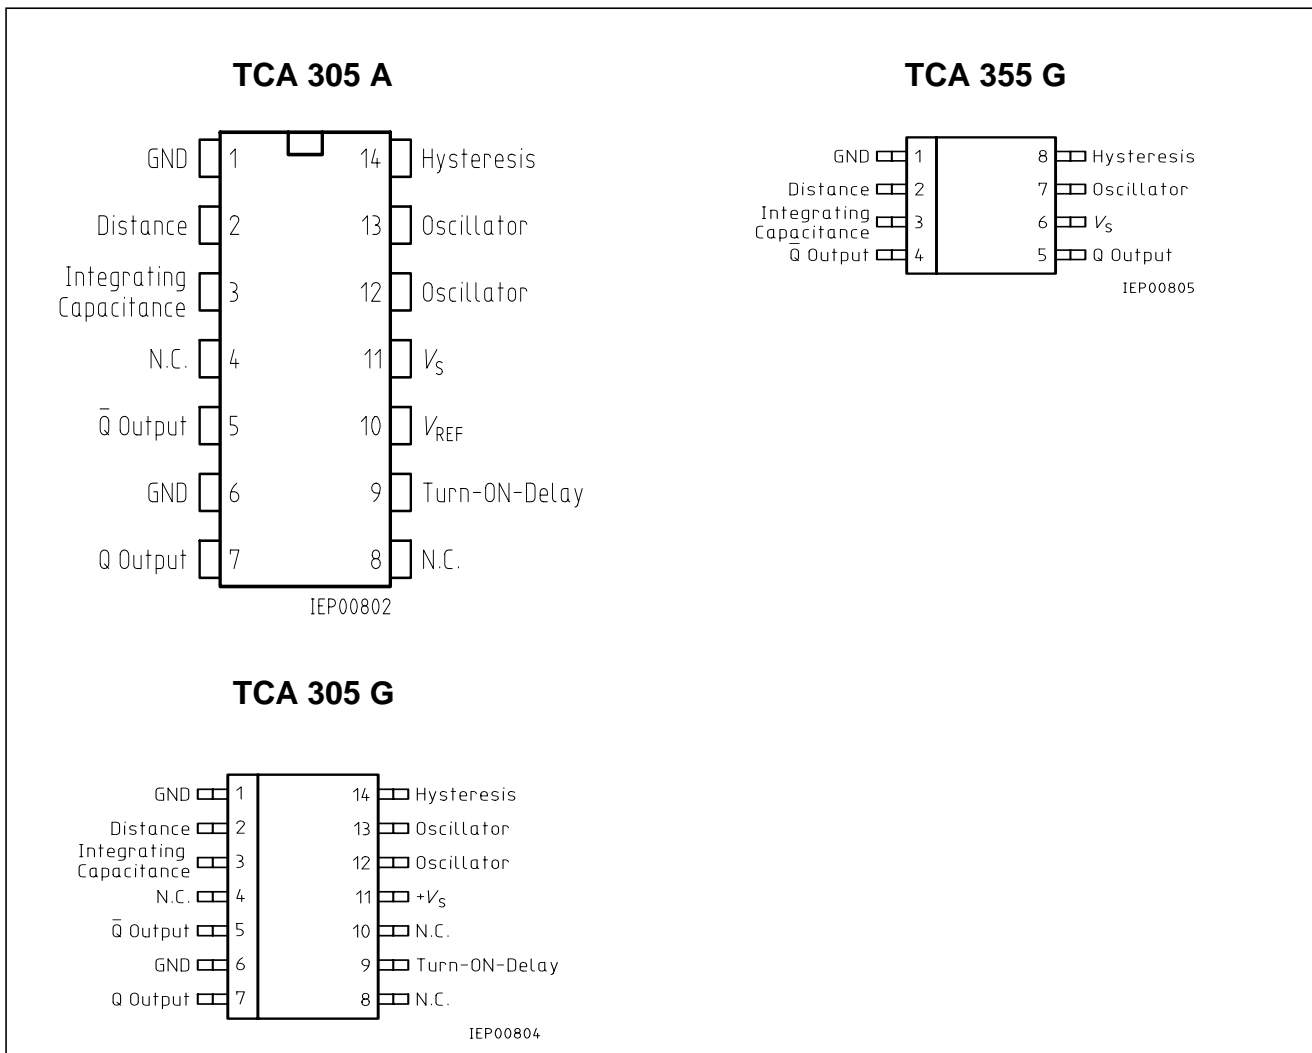

### Features

- Lower open-loop current consumption;  $I_s < 1 \text{ mA}$
- Lower output saturation voltage
- The temperature dependence of the switching distance is lower and compensation of the resonant circuit  $TC$  (temperature coefficient) is easier
- The sensitivity is higher, so that larger switching distances are possible and coils of a lower quality can be used
- The switching hysteresis remains constant as regards temperature, supply voltage and switching distance
- The TCA 305 even functions without external integrating capacitor. With an external capacitor (or with RC combination) good noise immunity can be achieved
- The outputs are temporarily short-circuit proof (approx. 10 s to 1 min depending on package)
- The outputs are disabled when  $V_s < \text{approx. } 4.5 \text{ V}$  and are enabled when the oscillator stabilizes (from  $V_{S \text{ min}} = 5 \text{ V}$ )
- Higher switching frequencies can be obtained
- Pb-free lead plating; RoHS compliant

## Pin Configurations (top view)

The devices TCA 305 and TCA 355 contain all the functions necessary to design inductive proximity switches. By approaching a standard metal plate to the coil, the resonant circuit is damped and the outputs are switched.

### Operation Schematic: see TCA 205

The types TCA 305 and TCA 355 have been developed from the type TCA 205 and are outstanding for the following characteristics:

<sup>1)</sup> TCA 305 only

<sup>2)</sup> Values in parenthesis apply to TCA 355 only

<sup>3)</sup> Operation at voltages less than 5 V (between approx. 2.5 and 5 V) is possible, if  $V_{REF}$  is connected to  $V_S$ . In this case  $V_{REF}$  is no longer internally stabilized. Additionally, the pin "turn-on delay" is to be applied as follows: If no turn-on delay is needed, this pin has to be connected to  $V_S$ . If, however, a turn-on delay is required, the charge current for  $D_D$  has to be adjusted with an external resistor between this pin and  $V_S$  (recommended value 390 k $\Omega$ ).

**Application Circuit**

$L_0, C_0$	Resonant circuit
$R_{Hy}$	Hysteresis adjustment
$R_{Di}$	Distance adjustment
$D$	Temperature compensation of the resonant circuit; possibly with series resistance for the purpose of adjustment. The diode is not absolutely necessary. Whether it is used or not depends on the temperature coefficient of the resonant circuit.
$R_i; C_i$	Integration element. At pin 3 (integrating capacitance) we recommend a capacitor of typ. 1 nF. To increase noise immunity this capacitor can be substituted by an RC circuit with, e.g., $R_i = 1 M\Omega$ and $C_i = 10 nF$ .
$C_D$	Delay capacitor
