## Application Information

### Bypassing and PC Board Layout

The ACPL-071L and ACPL-074L optocouplers are extremely easy to use. ACPL-071L and ACPL-074L provide CMOS logic output due to the high-speed CMOS IC technology used.

The external components required for proper operation are the input limiting resistor and the output bypass capacitor. Capacitor should be placed as close as possible to the optocoupler and values should be between 0.01  $\mu\text{F}$  and 0.1  $\mu\text{F}$ .

Figure 8: Recommended Printed Circuit Board Layout

### Powering Sequence

$V_{DD}$  needs to achieve a minimum level of 3.0V before powering up the output connecting component.

### Input Limiting Resistors

ACPL-071L and ACPL-074L are direct current driven (Figure 8), and thus eliminate the need for input power supply. To limit the amount of current flowing through the LED, it is recommended that a 210 $\Omega$  resistor is connected in series with anode of LED (that is, Pin 2 for ACPL-071L and Pins 1 and 4 for ACPL-074L) at 5V input signal. At 3.3V input signal, it is recommended to connect a 80 $\Omega$  resistor in series with anode of LED.

The recommended limiting resistors are based on the assumption that the driver output impedance is 50 (as shown in Figure 9).

Figure 9: Connection of Peaking capacitor ( $C_{peak}$ ) in Parallel of the Input Limiting Resistor ( $R_{limit}$ ) to Improve Speed Performance

## Speed Improvement

A peaking capacitor can be placed across the input current limit resistor (Figure 9) to achieve enhanced speed performance. The value of the peaking cap is dependent to the rise and fall time of the input signal and supply voltages

and LED input driving current ( $I_f$ ). Figure 10 shows significant improvement of propagation delay and pulse width with distortion with added peak capacitor at driving current of 14 mA and 3.3V or 5V power supply.

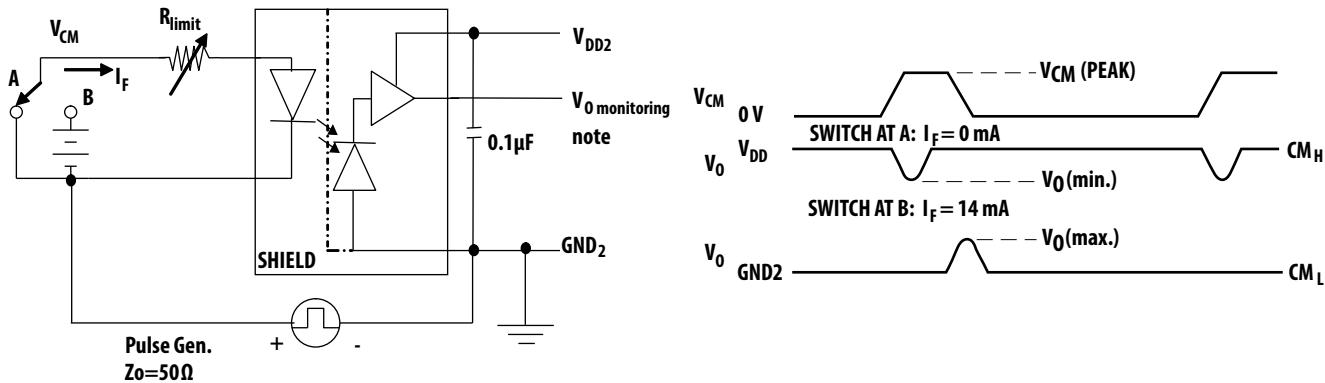

Figure 11: Test circuit for Common Mode Transient Immunity and Typical Waveforms.  $R_{total}$  is the total resistance of the driver output impedance (which is assumed to be 50Ω) and the limiting resistor ( $R_{total} = R_{drv} + R_{limit}$ ).
