

Octal Channel 14-Bit, 80 MSPS High-SNR and Low-Power ADC

Check for Samples: [ADS5294](#)

FEATURES

- **Maximum Sample Rate: 80 MSPS/14-Bit**
- **High Signal-to-Noise Ratio**
 - **75.5-dBFS SNR at 5 MHz/80 MSPS**
 - **78.2-dBFS SNR at 5 MHz/80 MSPS and Decimation Filter Enabled**
 - **84-dBc SFDR at 5 MHz/80 MSPS**
- **Low Power Consumption**
 - **58 mW/CH at 50 MSPS**
 - **77 mW/CH at 80 MSPS (2 LVDS Wire Per Channel)**
- **Digital Processing Block**
 - **Programmable FIR Decimation Filter and Oversampling to Minimize Harmonic Interference**
 - **Programmable IIR High Pass Filter to Minimize DC Offset**
 - **Programmable Digital Gain: 0 dB to 12 dB**
 - **2- or 4- Channel Averaging**
- **Flexible Serialized LVDS Outputs:**
 - **One or Two Wires of LVDS Output Lines per Channel Depending on ADC Sampling Rate**
 - **Programmable Mapping Between ADC Input Channels and LVDS Output Pins-Eases Board Design**
 - **Variety of Test Patterns to Verify Data Capture by FPGA/Receiver**
- **Internal and External References**
- **1.8V Operation for Low Power Consumption**
- **Low-Frequency Noise Suppression**
- **Recovery From 6-dB Overload within 1 Clock Cycle**
- **Package: 12-mm × 12-mm 80-Pin QFP**

APPLICATIONS

- **Ultrasound Imaging**
- **Communication Applications**
- **Multi-channel Data Acquisition**

DESCRIPTION

Using CMOS process technology and innovative circuit techniques, the ADS5294 is a low power 80MSPS 8-Channel ADC. Low power consumption, high SNR, low SFDR, and consistent overload recovery allow users to design high performance systems.

The ADS5294 has a digital processing block that integrates several commonly used digital functions for improving system performance. It includes a digital filter module that has built-in decimation filters (with low-pass, high-pass and band-pass characteristics). The decimation rate is also programmable (by 2, by 4, or by 8). This makes it useful for narrow-band applications, where the filters can be used conveniently to improve SNR and knock-off harmonics, while at the same time reducing the output data rate. The device includes an averaging mode where two channels (or even four channels) can be averaged to improve SNR.

Serial LVDS outputs reduce the number of interface lines and enable the highest system integration. The digital data from each channel ADC can be output over one or two wires of LVDS output lines depending on the ADC sampling rate. This 2-wire interface helps keep the serial data rate low, allowing low cost FPGA based receivers to be used even at high sample rate. The ADC resolution can be programmed to 12 bit or 14 bit through registers. A very unique feature is the programmable mapping module that allows flexible mapping between the input channels and the LVDS output pins. This helps greatly reduce the complexity of LVDS output routing and can potentially result in cheaper system boards by reducing the number of PCB layers.

The device integrates an internal reference trimmed to accurately match across devices. Best performance is expected to be achieved through the internal reference mode. The device can be driven with external references as well.

The device is available in a 12 mm × 12 mm 80-pin QFP. It is specified over a –40°C to 85°C operating temperature range. ADS5294 is completely pin-to-pin and register compatible to ADS5292.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ADS5294

SLAS776B –NOVEMBER 2011–REVISED JULY 2012

www.ti.com

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PIN CONFIGURATION
**80-PIN TQFP WITH THERMAL PAD
PFP PACKAGE (TOP VIEW)**

PIN FUNCTIONS

| NUMBER OF PINS | PIN | | DESCRIPTION |
|----------------|------------|----------------------|--|
| | NAME | NUMBER | |
| 5 | AVDD | 9, 52, 66, 71, 74 | Analog power supply, 1.8V |
| 6 | AGND | 3, 6, 55, 58, 61, 80 | Analog ground |
| 1 | VCM | 68 | Common-mode output pin, 0.95 V output. This pin can be configured as the external reference voltage (1.5 V) input pin as well. See Reg 0x42. |
| 1 | CLKN | 73 | Negative differential clock –Tie CLKN to GND for single-ended clock |
| 1 | CLKP | 72 | Positive differential clock |
| 2 | IN1P, IN1N | 78, 79 | Differential input signal, Channel 1 |
| 2 | IN2P, IN2N | 1, 2 | Differential input signal, Channel 2 |
| 2 | IN3P, IN3N | 4, 5 | Differential input signal, Channel 3 |

PIN FUNCTIONS (continued)

| NUMBER OF PINS | PIN | | DESCRIPTION |
|----------------|------------------|--------|--|
| | NAME | NUMBER | |
| 2 | IN4P, IN4N | 7, 8 | Differential input signal, Channel 4 |
| 2 | IN5P, IN5N | 53, 54 | Differential input signal, Channel 5 |
| 2 | IN6P, IN6N | 56, 57 | Differential input signal, Channel 6 |
| 2 | IN7P, IN7N | 59, 60 | Differential input signal, Channel 7 |
| 2 | IN8P, IN8N | 62, 63 | Differential input signal, Channel 8 |
| 2 | LCLKP, LCLKN | 31, 32 | Differential LVDS bit clock (7X) |
| 2 | ACLKP, ACLKN | 29, 30 | Differential LVDS frame clock (1X) |
| 2 | OUT1A_P, OUT1A_N | 13, 14 | Differential LVDS data output, wire 1, channel 1 |
| 2 | OUT1B_P, OUT1B_N | 15, 16 | Differential LVDS data output, wire 2, channel 1 |
| 2 | OUT2A_P, OUT2A_N | 17, 18 | Differential LVDS data output, wire 1, channel 2 |
| 2 | OUT2B_P, OUT2B_N | 19, 20 | Differential LVDS data output, wire 2, channel 2 |
| 2 | OUT3A_P, OUT3A_N | 21, 22 | Differential LVDS data output, wire 1, channel 3 |
| 2 | OUT3B_P, OUT3B_N | 23, 24 | Differential LVDS data output, wire 2, channel 3 |
| 2 | OUT4A_P, OUT4A_N | 25, 26 | Differential LVDS data output, wire 1, channel 4 |
| 2 | OUT4B_P, OUT4B_N | 27, 28 | Differential LVDS data output, wire 2, channel 4 |
| 2 | OUT5A_P, OUT5A_N | 35, 36 | Differential LVDS data output, wire 1, channel 5 |
| 2 | OUT5B_P, OUT5B_N | 33, 34 | Differential LVDS data output, wire 2, channel 5 |
| 2 | OUT6A_P, OUT6A_N | 39, 40 | Differential LVDS data output, wire 1, channel 6 |
| 2 | OUT6B_P, OUT6B_N | 37, 38 | Differential LVDS data output, wire 2, channel 6 |
| 2 | OUT7A_P, OUT7A_N | 43, 44 | Differential LVDS data output, wire 1, channel 7 |
| 2 | OUT7B_P, OUT7B_N | 41, 42 | Differential LVDS data output, wire 2, channel 7 |
| 2 | OUT8A_P, OUT8A_N | 47, 48 | Differential LVDS data output, wire 1, channel 8 |
| 2 | OUT8B_P, OUT8B_N | 45, 46 | Differential LVDS data output, wire 2, channel 8 |
| 1 | PD | 10 | Power down control input. Active High. The pin has an internal 220-kΩ pulldown resistor. |
| 1 | REFB | 69 | Negative reference input/ output |
| 1 | REFT | 70 | Positive reference input/ output |
| 1 | RESET | 51 | Active HIGH RESET input. The pin has an internal 220-kΩ pulldown resistor. |
| 1 | SCLK | 77 | Serial clock input. The pin has an internal 220-kΩ pulldown resistor. |
| 1 | SDATA | 76 | Serial data input. The pin has an internal 220-kΩ pulldown resistor. |
| 1 | SDOUT | 64 | Serial data readout. This pin is in the high-impedance state after reset. When the <READOUT> bit is set, the SDOUT pin becomes active. This is a CMOS digital output running from the AVDD supply. |
| 1 | CSZ | 75 | Serial enable chip select – active low digital input |
| 1 | SYNC | 65 | Input signal to synchronize channels and chips when used with reduced output data rates. If it is not used, add a ≤ 10 KΩ pull-down resistor. |
| 2 | LVDD | 11, 49 | Digital and I/O power supply, 1.8V |
| 2 | LGND | 12, 50 | Digital ground |
| 1 | NC | 67 | No Connection. Must leave floated |

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

| | | VALUE | | UNIT |
|---|---|-------|--------------------|------|
| | | MIN | MAX | |
| Supply voltage | AVDD | -0.3 | 2.2 | V |
| | LVDD | -0.3 | 2.2 | V |
| Voltage | between AGND and LGND | -0.3 | 0.3 | V |
| | at analog inputs | -0.3 | min[2.2, AVDD+0.3] | V |
| | at digital inputs, CLKN, CLKP ⁽²⁾ , RESET, SCLK, SDATA, \overline{CSZ} | -0.3 | min[2.2, AVDD+0.3] | V |
| | at digital outputs | -0.3 | min[2.2, LVDD+0.3] | V |
| Maximum junction temperature (T _J), any condition | | | 105 | °C |
| Storage temperature range | | -55 | 150 | °C |
| Operating temperature range | | -40 | 85 | °C |
| ESD Ratings | Human Body Model (HBM) | | 2000 | V |
| | Charged Device Model (CDM) | | 500 | V |

- (1) Stresses above those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rated conditions for extended periods may degrade device reliability.
- (2) When AVDD is turned off, it is recommended to switch off the input clock (or ensure the voltage on CLKP, CLKN is < |0.3V|. This prevents the ESD protection diodes at the clock input pins from turning on.

THERMAL INFORMATION

| THERMAL METRIC ⁽¹⁾ | | ADS5294 | UNITS |
|-------------------------------|--|---------------|-------|
| | | PFP (80 PINS) | |
| θ_{JA} | Junction-to-ambient thermal resistance | 30.8 | °C/W |
| θ_{JCTop} | Junction-to-case (top) thermal resistance | 6.3 | |
| θ_{JB} | Junction-to-board thermal resistance | 8.3 | |
| Ψ_{JT} | Junction-to-top characterization parameter | 0.2 | |
| Ψ_{JB} | Junction-to-board characterization parameter | 8.2 | |
| θ_{JCbott} | Junction-to-case (bottom) thermal resistance | 0.3 | |

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

RECOMMENDED OPERATING CONDITIONS

| | | MIN | TYP | MAX | UNIT |
|---|--|-----------------------|-----|----------|------|
| SUPPLIES | | | | | |
| AVDD | Analog supply voltage | 1.7 | 1.8 | 1.9 | V |
| LVDD | Digital supply voltage | 1.7 | 1.8 | 1.9 | V |
| ANALOG INPUTS/OUTPUTS | | | | | |
| Differential input voltage range | | 2 | | V_{PP} | |
| Input common-mode voltage | | 0.95±0.05 | | V | |
| REF _T | External reference mode | 1.45 | | V | |
| REF _B | External reference mode | 0.45 | | V | |
| VCM | Common-mode voltage output | 0.95 | | V | |
| | External Reference mode Input | 1.5 | | V | |
| Maximum Input Frequency ⁽¹⁾ | | 2 V_{PP} amplitude | | 80 MHz | |
| CLOCK INPUTS | | | | | |
| ADC Clock input sample rate | | 10 | | 80 | MSPS |
| Input Clock amplitude differential ($V_{(CLKP)} - V_{(CLKN)}$) peak-to-peak | | Sine wave, AC-coupled | | 0.2 | 1.5 |
| | | LVPECL, AC-coupled | | 0.2 | 1.6 |
| | | LVDS, AC-coupled | | 0.2 | 0.7 |
| V _{IL} | Input Clock CMOS single-ended ($V_{(CLKP)}$) | | | <0.3 | V |
| V _{IH} | | | | >1.5 | V |
| Input clock duty cycle | | 35% | 50% | 65% | |
| DIGITAL OUTPUTS | | | | | |
| ACLKP and ACLKN outputs (LVDS), 1-wire interface | | 1x (sample rate) | | MSPS | |
| LCLKP and LCLKN outputs (LVDS), 1-wire interface | | 7x (sample rate) | | MSPS | |
| ACLKP and ACLKN outputs (LVDS), 2-wire interface | | 0.5x (sample rate) | | MSPS | |
| LCLKP and LCLKN outputs (LVDS), 2-wire interface | | 3.5x (sample rate) | | MSPS | |
| Maximum data rate, 2-wire interface | | 560 | | Mbps | |
| Maximum data rate, 1-wire interface | | 700 | | Mbps | |
| C _{LOAD} | Maximum external capacitance from each output pin to LGND | 5 | | pF | |
| R _{LOAD} | Differential load resistance between the LVDS output pairs | 100 | | Ω | |
| T _A | Operating free-air temperature | -40 | | 85 | °C |

(1) See the [Large and Small Signal Input Bandwidth](#) section.

ELECTRICAL CHARACTERISTICS DYNAMIC PERFORMANCE

Typical values are at 25°C, AVDD = 1.8 V, LVDD = 1.8 V, 50% clock duty cycle, –1 dBFS differential analog input, Sample rate = 80 MSPS, ADC is configured in internal reference mode (unless otherwise noted). MIN and MAX values are across the full temperature range T_{MIN} = –40°C to T_{MAX} = 85°C, AVDD = 1.8 V, LVDD = 1.8 V.

| PARAMETERS | | CONDITIONS | MIN | TYP | MAX | UNITS |
|------------------------------|--|---|--------------|------|-----|-----------------|
| AC PERFORMANCE | | | | | | |
| SNR | Signal-to-noise ratio | f _{in} = 10 MHz, 65 MSPS | | 75.6 | | dBFS |
| | | f _{in} = 5 MHz, T _A = 25°C | 72.8 | 75.5 | | dBFS |
| | | f _{in} = 5 MHz, Across temperatures | 71.8 | | | dBFS |
| | | f _{in} = 5 MHz, -60 dBFS Input signal amplitude | | 77.3 | | dBFS |
| | | f _{in} = 5 MHz, Decimation by two enabled | | 78.2 | | dBFS |
| | | f _{in} = 30 MHz | | 74.2 | | dBFS |
| | | f _{in} = 65 MHz | | 71.7 | | dBFS |
| SINAD | Signal-to-noise and distortion ratio | f _{in} = 5 MHz | | 74.8 | | dBFS |
| | | f _{in} = 30 MHz | | 73.4 | | dBFS |
| | | f _{in} = 65 MHz | | 70 | | dBFS |
| ENOB | Effective number of bits | f _{in} = 5 MHz | | 12.2 | | Bits |
| DNL | Differential nonlinearity | f _{in} = 5 MHz | –0.96 | ±0.5 | 1.7 | LSB |
| INL | Integral nonlinearity | f _{in} = 5 MHz | | 2.2 | 5.5 | LSB |
| SFDR | Spurious-free dynamic range | f _{in} = 5 MHz | 72 | 84 | | dBc |
| | | f _{in} = 30 MHz | | 81 | | dBc |
| | | f _{in} = 65 MHz | | 74 | | dBc |

DIGITAL CHARACTERISTICS

The DC specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level 0 or 1. AVDD = 1.8V, LVDD = 1.8V

| PARAMETERS | | CONDITION | MIN | TYP | MAX | UNITS |
|-------------------------------|--|---|------|------------|------|-------|
| DIGITAL INPUTS/OUTPUTS | | | | | | |
| V _{IH} | Logic high input voltage | All digital inputs support 1.8-V and 3.3-V CMOS logic levels. | 1.3 | | | V |
| V _{IL} | Logic low input voltage | | | | 0.4 | V |
| I _{IH} | Logic high input current | V _{HIGH} = 1.8 V | | 6 | | μA |
| I _{IL} | Logic low input current | V _{LOW} = 0 V | | < 0.1 | | μA |
| V _{OH} | Logic high output voltage | | | AVDD - 0.1 | | V |
| V _{OL} | Logic low output voltage | | | 0.2 | | V |
| LVDS OUTPUTS | | | | | | |
| V _{ODH} | High-level output differential voltage | 100 Ω external termination | 245 | 350 | 405 | mV |
| V _{ODL} | Low-level output differential voltage | 100 Ω external termination | -245 | -350 | -405 | mV |
| V _{OCM} | Output common-mode voltage | | 900 | 1100 | 1300 | mV |

*With external 100-Ω termination

Figure 2. LVDS Output Voltage Levels

TIMING REQUIREMENTS⁽¹⁾⁽²⁾⁽³⁾

Typical values are at 25°C, AVDD = 1.8 V, LVDD = 1.8 V, sampling frequency = 80 MSPS, 14-bit, sine wave input clock = 1.5 Vpp clock amplitude, C_{LOAD} = 5 pF, R_{LOAD} = 100 Ω, unless otherwise noted. MIN and MAX values are across the full temperature range T_{MIN} = -40°C to T_{MAX} = 85°C, AVDD = 1.8 V, LVDD = 1.7 V to 1.9 V

| PARAMETERS | | CONDITIONS | MIN | TYP | MAX | UNITS |
|----------------------|--------------------------------|--|---|-------|-----|--------------|
| t _a | Aperture delay | The delay in time between the rising edge of the input sampling clock and the actual time at which the sampling occurs | | 4 | | ns |
| | Aperture delay variation | Across channels within the same device | | ±175 | | ps |
| | | Across devices at the same temperature and LVDD supply | | 2.5 | | ns |
| t _j | Aperture jitter RMS | | | 320 | | fs rms |
| t _d | Data latency | 1-wire LVDS output interface | | 11 | | Clock cycles |
| | | 2-wire LVDS output interface | | 15 | | Clock cycles |
| t _{SU} | Data setup time | 80 MSPS, 2 wire LVDS, 7x serialization | 0.34 | 0.57 | | ns |
| t _H | Data hold time | 80 MSPS, 2 wire LVDS, 7x serialization | 0.55 | 0.8 | | ns |
| t _{PROP} | Clock propagation delay | Input clock rising edge(zero cross) to frame clock rising edge(zero cross) | See Table 1 and Table 2 | | | |
| | Variation of t _{PROP} | Between two devices at same temperature and LVDD supply | | ±0.75 | | ns |
| | LVDS bit clock duty cycle | | | 48% | | |
| t _{RISE} | Data rise time | Rise time is from -100 mV to +100 mV, 10 ≤ Fs ≤ 80 MSPS | | 0.24 | | ns |
| t _{FALL} | Data fall time | Fall time is from +100 mV to -100 mV, 10 ≤ Fs ≤ 80 MSPS | | 0.24 | | ns |
| t _{CLKRISE} | Output clock rise time | Rise time is from -100 mV to +100 mV, 10 ≤ Fs ≤ 80 MSPS | | 0.20 | | ns |
| t _{CLKFALL} | Output clock fall time | Fall time is from +100 mV to -100 mV, 10 ≤ Fs ≤ 80 MSPS | | 0.20 | | ns |
| t _{WAKE} | Wake-up Time | Time to valid data after coming out of COMPLETE POWER-DOWN mode | | 100 | | μs |
| | | Time to valid data after coming out of PARTIAL POWER-DOWN mode (with clock continuing to run during power-down) | | 5 | | μs |

- (1) Timing parameters are ensured by design and characterization and not tested in production.
- (2) Measurements are done with a transmission line of 100-Ω characteristic impedance between the device and the load. Setup and hold time specifications take into account the effect of jitter on the output data and clock.
- (3) Data valid refers to logic HIGH of 100 mV and logic LOW of -100 mV.

Table 1. LVDS Timing at Different Sampling Frequencies - 2 Wire Interface, 7x Serialization ⁽¹⁾

| LVDS Output Rate (MSPS) | Setup Time (t_{su}), ns | | | Hold Time (t_h), ns | | | $t_{PROG} = (6/7) \times T + t_{delay}$, ns ⁽²⁾ | | |

SERIAL INTERFACE

ADS5294 has a set of internal registers that can be accessed by the serial interface formed by pins CSZ (Serial interface Enable – Active Low), SCLK (Serial Interface Clock) and SDATA (Serial Interface Data).

When CSZ is low,

- Serial shift of bits into the device is enabled.
- Serial data (SDATA) is latched at every rising edge of SCLK.
- SDATA is loaded into the register at every 24th SCLK rising edge

If the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active CSZ pulse. The first eight bits form the register address and the remaining 16 bits the register data. The interface can work with SCLK frequencies from 15 MHz down to very low speeds (few Hertz) and also with non-50% SCLK duty cycle.

Register Initialization

After power-up, the internal registers must be initialized to the respective default values. Initialization can be done in one of two ways:

1. Through a hardware reset, by applying a high pulse on the RESET pin; or
2. Through a software reset; using the serial interface, set the RST bit high. Setting this bit initializes the internal registers to the respective default values and then self-resets the bit low. In this case, the RESET pin stays low (inactive).

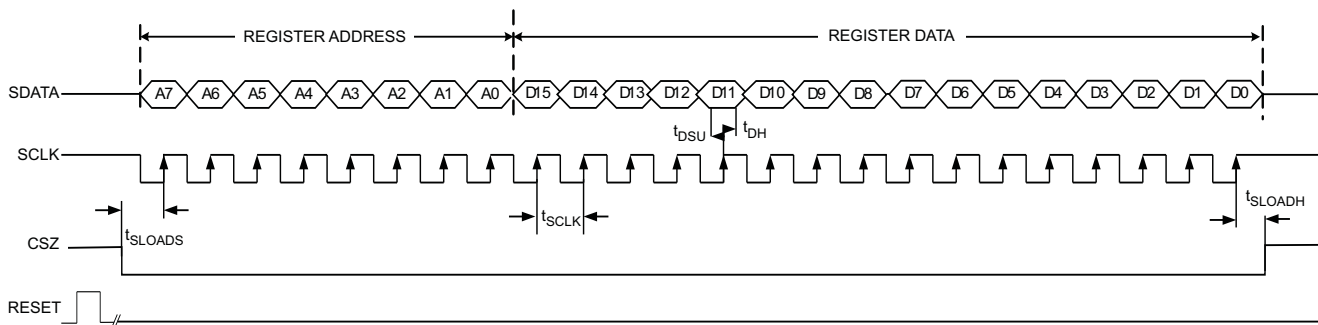

Figure 44. Serial Interface Timing

SERIAL INTERFACE TIMING CHARACTERISTICS

Typical values at 25°C, MIN and MAX values across the full temperature range $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$, $AVDD = 1.8\text{ V}$, $LVDD = 1.8\text{ V}$, unless otherwise noted.

| PARAMETER | | MIN | TYP | MAX | UNIT |
|--------------|------------------------------------|------|-----|-----|------|
| f_{SCLK} | SCLK frequency (= $1 / t_{SCLK}$) | > DC | 15 | | MHz |
| t_{SLOADS} | \overline{CS} to SCLK setup time | 33 | | | ns |
| t_{SLOADH} | SCLK to \overline{CS} hold time | 33 | | | ns |
| t_{DS} | SDATA setup time | 33 | | | ns |
| t_{DH} | SDATA hold time | 33 | | | ns |

RESET TIMING

Typical values at 25°C, MIN and MAX values across the full temperature range $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$ (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------|----------------------|-----|-----|-----|------|
| t_1 | Power-on delay | | 1 | | ms |
| t_2 | Reset pulse duration | 50 | | | ns |
| t_3 | Register write delay | | 100 | | ns |

NOTE: A high-going pulse on RESET pin is required in serial interface mode in case of initialization through hardware reset. For parallel interface operation, RESET has to be tied permanently HIGH.

Figure 45. Reset Timing Diagram

Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back on SDOOUT pin. This may be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC.

By default, after power up and device reset, the SDOOUT pin is in the high-impedance state. When the readout mode is enabled using the register bit <READOUT>, SDOOUT outputs the contents of the selected register serially, described as follows.

- Set register bit <READOUT> = 1 to put the device in serial readout mode. This disables any further writes into the internal registers, EXCEPT the register at address 1. Note that the <READOUT> bit itself is also located in register 1.
The device can exit readout mode by writing <READOUT> to 0.
Only the contents of register at address 1 cannot be read in the register readout mode.
- Initiate a serial interface cycle specifying the address of the register (A7-A0) whose content is to be read.
- The device serially outputs the contents (D15–D0) of the selected register on the SDOOUT pin.
- The external controller can latch the contents at the rising edge of SCLK.
- To exit the serial readout mode, reset register bit <READOUT> = 0, which enables writes into all registers of the device. At this point, the SDOOUT pin enters the high-impedance state.

A) Enable Serial Readout (<READOUT> = 1)

B) Read Contents of Register 0x0F.
This Register has been Initialized with 0x0200
(The Device was earlier put in global power down)

Figure 46. Serial Readout Timing

DEFAULT STATES AFTER RESET

- Device is in normal operation mode with 14-bit ADC enabled for all channels.
- Output interface is 1-wire, 14x serialization with 7xbit clock and 1xframe clock frequency
- Serial readout is disabled
- PDN pin is configured as global power-down pin
- Digital gain is set to 0 dB.
- Digital modes such as LFNS, digital filters, and so on, are disabled.

Register Map

Table 3. Summary of Functions Supported by Serial Interface ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

DESCRIPTION OF SERIAL REGISTERS

POWER-DOWN MODES

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | NAME |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|--------------|
| 0F | | | | | | | | | X | X | X | X | X | X | X | X | PDN_CH<8:1> |
| | | | | | | | | X | | | | | | | | | PDN_PARTIAL |
| | | | | | | | X | | | | | | | | | | PDN_COMPLETE |
| | | | | | | X | | | | | | | | | | | PDN_PIN_CFG |

Each of the 8 channels can be individually powered down. PDN_CH<N> controls the power-down mode for ADC channel <N>. In addition to channel-specific power-down, the ADS5294 also has two global power-down modes:

1. The partial power-down mode. It partially powers down the chip; recovery time from the partial power-down mode is about 10 μ s provided that the clock has been running for at least 50 μ s before exiting this mode.
2. The complete power-down mode. It completely powers down the chip, and involves a much longer recovery time 100 μ s.

In addition to programming the chip in either of these two power-down modes (through either the PDN_PARTIAL or PDN_COMPLETE bits), the PD pin itself can be configured as either a partial power-down pin or a complete power-down pin control. For example, if PDN_PIN_CFG=0 (default), when the PD pin is high, the device enters complete power-down mode. However, if PDN_PIN_CFG=1, when the PD pin is high, the device enters partial power-down mode.

LOW FREQUENCY NOISE SUPPRESSION MODE

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | NAME |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|--------------|
| 14 | | | | | | | | | X | X | X | X | X | X | X | X | LFNS_CH<8:1> |

The low frequency noise suppression mode is specifically useful in applications where good noise performance is desired in the frequency band of 0 to 1 MHz (around DC). Setting this mode shifts the low-frequency noise of the ADS5294 to approximately $F_s/2$, thereby, moving the noise floor around DC to a much lower value. LFNS_CH<8:1> enables this mode individually for each channel. See [Figure 38](#) and [Figure 39](#).

ANALOG INPUT INVERT

| 24 | | | | | | | | | X | X | X | X | X | X | X | X | INVERT_CH<8:1> |

ADS5294

SLAS776B – NOVEMBER 2011 – REVISED JULY 2012

www.ti.com

Normally, IN_P pin represents the positive analog input pin, and INN represents the complementary negative input. Setting the bits marked $INVERT_CH<8:1>$ (individual control for each channel) causes the inputs to be swapped. IN_N now represents the positive input, and IN_P the negative input.

LVDS TEST PATTERNS

| 26 | X | X | X | X | X | X | X | X | X | X | X | X | | | | | BITS_CUSTOM1<11:0> | |
| 27 | X | X | X | X | X | X | X | X | X | X | X | X | | | | | BITS_CUSTOM2<11:0> | |
| 45 | | | | | | | | | | | | | | | 0 | X | PAT_DESKEW | |
| | | | | | | | | | | | | | | | X | 0 | PAT_SYNC | |

The ADS5294 can output a variety of test patterns on the LVDS outputs. These test patterns replace the normal ADC data output. All these patterns can be synchronized across devices by the sync function either through the hardware SYNC pin or the software sync bit TP_SOFT_SYNC bit in register 0x25. TP_HARD_SYNC bit when set enables the Test patterns to be synchronized by the hardware SYNC Pin. When the software sync bit TP_SOFT_SYNC bit is set, special timing is needed.

- Setting EN_RAMP to 1 causes all the channels to output a repeating full-scale ramp pattern. The ramp increments from zero code to full-scale code in steps of 1 LSB every clock cycle. After hitting the full scale code, it returns back to zero code and ramps again.
- The device can also be programmed to output a constant code by setting SINGLE_CUSTOM_PAT to 1, and programming the desired code in BITS_CUSTOM1<13:0>. In this mode, BITS_CUSTOM1<13:0> take the place of the 14-bit ADC data at the output, and are controlled by LSB-first and MSB-first modes the same way as normal ADC data are.
- The device may also be made to toggle between two consecutive codes, by programming DUAL_CUSTOM_PAT to 1. The two codes are represented by the contents of BITS_CUSTOM1<13:0> and BITS_CUSTOM2<13:0>.
- In addition to custom patterns, the device may also be made to output two preset patterns:
 - **Deskew patten** – Set using PAT_DESKEW, this mode replaces the 14-bit ADC output D<13:0> with the 0101010101010101 word.
 - **Sync pattern** – Set using PAT_SYNC, the normal ADC word is replaced by a fixed 11111110000000 word.
 - **PRBS patterns:** The device can give 9 bit or 23 bit LFSR Pseudo random pattern on the channel outputs that are controlled by the register 0x25. To enable the PRBS pattern PRBS_TP_EN bit in the register 0x25 needs to be set. Default is the 23 bit LFSR but 9 bit LFSR can be chosen by setting PRBS_MODE_2 bit. The seed value for the PRBS patterns can be chosen by enabling the PRBS_SEED_FROM_REG bit to 1 and the value written to the PRBS_SEED registers in 0x24 and 0x23.

Note that only one of the above patterns should be active at any given instant.

BIT-BYTE-WORD WISE OUTPUT

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | NAME |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|---------------------------|
| 28 | x | | | | | | | | | | | | | | | | EN_BITORDER |
| | 0 | | | | | | | x | | | | | | | | | BIT_WISE |
| | 1 | | | | | | | | x | x | x | x | x | x | x | x | EN_WORDWISE_B Y_CH<7:> |

Register 0x28 can select the LVDS ADC output as bit-wise,byte-wise or word-wise in the two wire mode. Figure 47 and Figure 48 illustrate the details.

Figure 48. 14-Bit Word Wise

DIGITAL PROCESSING BLOCKS

The ADS5294 integrates a set of commonly useful digital functions that can be used to ease system design. These functions are shown in the digital block diagram of [Figure 49](#) and described in the following sections.

Figure 49. Digital Processing Block Diagram

PROGRAMMABLE DIGITAL GAIN

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | NAME |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|---------------|
| 2A | | | | | | | | | | | | | X | X | X | X | GAIN_CH1<3:0> |
| | | | | | | | | | X | X | X | X | | | | | GAIN_CH2<3:0> |
| | | | | | X | X | X | X | | | | | | | | | GAIN_CH3<3:0> |
| | X | X | X | X | | | | | | | | | | | | | GAIN_CH4<3:0> |
| 2B | X | X | X | X | | | | | | | | | | | | | GAIN_CH5<3:0> |
| | | | | | X | X | X | X | | | | | | | | | GAIN_CH6<3:0> |
| | | | | | | | | | X | X | X | X | | | | | GAIN_CH7<3:0> |
| | | | | | | | | | | | | | X | X | X | X | GAIN_CH8<3:0> |

In applications where the full scale swing of the analog input signal is much less than the 2 V_{PP} range supported by the ADS5294, a programmable gain can be set to achieve the full-scale output code even with a lower analog input swing. The programmable gain for each channel can be individually set using a set of four bits, indicated as GAIN_CHN<3:0> for Channel N. The gain setting is coded in binary from 0-12 dB as shown in Table 4.

Table 4. Gain Setting for Channel N

| GAIN_CHN<3> | GAIN_CHN<2> | GAIN_CHN<1> | GAIN_CHN<0> | CHANNEL N GAIN SETTING |
|-------------|-------------|-------------|-------------|------------------------|
| 0 | 0 | 0 | 0 | 0 dB |

| | | | | | | | | | | | | | | | X | X | AVG_CTRL1<1:0> |
| 2D | | | | | | X | X | | | | | | | | | | AVG_CTRL8<1:0> |
| | | | | | | | | | X | X | | | | | | | AVG_CTRL7<1:0> |
| | | | | | | | | | | | | X | X | | | | AVG_CTRL6<1:0> |
| | | | | | | | | | | | | | | | X | X | AVG_CTRL5<1:0> |

In the default mode of operation, the LVDS outputs <8..1> contain the data of the ADC Channels <8..1>. By setting the EN_CHANNEL_AVG bit to '1', the outputs from multiple channels can be averaged. The resulting outputs from the Channel averaging block (which is bypassed in the default mode) are referred to as Bins. The contents of the Bins <8..1> come out on the LVDS outputs <8..1>. The contents of each of the 8 bins are determined by the register bits marked AVG_CTRLn<1:0> where n stands for the Bin number. The different settings are shown below:

| AVG_CTRL1<1> | AVG_CTRL1<0> | Contents of Bin 1 |
|--------------|--------------|-----------------------------------|
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 1 |
| 1 | 0 | Average of ADC Channel 1, 2 |
| 1 | 1 | Average of ADC Channel 1, 2, 3, 4 |
| AVG_CTRL2<1> | AVG_CTRL2<0> | Contents of Bin 2 |
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 2 |
| 1 | 0 | ADC Channel 3 |
| 1 | 1 | Average of ADC Channel 3, 4 |
| AVG_CTRL3<1> | AVG_CTRL3<0> | Contents of Bin 3 |
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 3 |
| 1 | 0 | ADC Channel 2 |
| 1 | 1 | Average of ADC Channel 1, 2 |
| AVG_CTRL4<1> | AVG_CTRL4<0> | Contents of Bin 4 |
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 4 |
| 1 | 0 | Average of ADC Channel 3, 4 |
| 1 | 1 | Average of ADC Channel 1, 2, 3, 4 |
| AVG_CTRL5<1> | AVG_CTRL5<0> | Contents of Bin 5 |
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 5 |
| 1 | 0 | Average of ADC Channel 5, 6 |
| 1 | 1 | Average of ADC Channel 5, 6, 7, 8 |
| AVG_CTRL6<1> | AVG_CTRL6<0> | Contents of Bin 6 |
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 6 |
| 1 | 0 | ADC Channel 7 |
| 1 | 1 | Average of ADC Channel 7, 8 |
| AVG_CTRL7<1> | AVG_CTRL7<0> | Contents of Bin 7 |
| 0 | 0 | Zero |

| AVG_CTRL1<1> | AVG_CTRL1<0> | Contents of Bin 1 |
|--------------|--------------|-----------------------------------|
| 0 | 1 | ADC Channel 7 |
| 1 | 0 | ADC Channel 6 |
| 1 | 1 | Average of ADC Channel 6, 5 |
| AVG_CTRL8<1> | AVG_CTRL8<0> | Contents of Bin 8 |
| 0 | 0 | Zero |
| 0 | 1 | ADC Channel 8 |
| 1 | 0 | Average of ADC Channel 7, 8 |
| 1 | 1 | Average of ADC Channel 5, 6, 7, 8 |

When the contents of a particular bin is set to Zero, then the LVDS buffer corresponding to that bin gets automatically powered down.

| | | | | | | | | | | X | X | X | | | | | FILTER7_RATE<2:0> |
| 35 | | | | | | | | | | | | | | X | | | ODD_TAP7 |
| | | | | | | | X | X | X | | | | | | | | USE_FILTER7 |
| | | | | | | | | | | X | X | X | | | | | FILTER8_COEFF_SET<2:0> |
| | | | | | | | | | | | | | | X | | | FILTER8_RATE<2:0> |
| | | | | | | | | | | | | | | | X | | ODD_TAP8 |
| | | | | | | | | | | | | | | | | X | USE_FILTER8 |

The decimation filter is implemented as 24-tap FIR with symmetrical coefficients (each coefficient is 12-bit signed). The filter equation is:

$$y(n) = \left(\frac{1}{2^{11}} \right) \times [(h_0 \times x(n) + h_1 \times x(n-1) + h_2 \times x(n-2) + \dots + h_{11} \times x(n-11) + h_{11} \times x(n-12) + \dots + h_1 \times x(n-22) + h_0 \times x(n-23)] \quad (1)$$

By setting the register bit <ODD_TAPn> = 1, a 23-tap FIR is implemented:

$$y(n) = \left(\frac{1}{2^{11}} \right) \times \left[(h_0 \times x(n) + h_1 \times x(n-1) + h_2 \times x(n-2) + \dots + h_{10} \times x(n-10) + h_{11} \times x(n-11) + h_{10} \times x(n-12) + \dots + h_1 \times x(n-21) + h_0 \times x(n-22)) \right] \quad (2)$$

In [Equation 1](#) and [Equation 2](#), $h_0, h_1 \dots h_{11}$ are 12 bit signed representation of the coefficients, $x(n)$ is the input data sequence to the filter and $y(n)$ is the filter output sequence.

A decimation filter can be introduced at the output of each channel. To enable this feature, the GLOBAL_EN_FILTER should be set to '1'. Setting this bit to '1' increases the overall latency of each channel to 20 clock cycles irrespective of whether the filter for that particular channel has been chosen or not (using the USE_FILTER bit). The bits marked FILTER n _COEFF_SET<2:0>, FILTER n _RATE<2:0>, ODD_TAP n and USE_FILTER n represent the controls for the filter for Channel n . Note that these bits are functional only when the GLOBAL_EN_FILTER gets set to '1'. For illustration, the controls for channel 1 are listed in [Table 5](#):

The USE_FILTER1 bit determines whether the filter for Channel 1 is used or not. When this bit is set to '1', the filter for channel 1 is enabled. When this bit is set to '0', the filter for channel 1 is disabled but the channel data passes through a dummy delay so that the overall latency of channel 1 is 20 clock cycles. With the USE_FILTER1 bit set to '1', the characteristics of the filter can be set by using the other sets of bits.

The ADS5294 has 6 sets of filter coefficients stored in memory. Each of these sets define a unique pass band in the frequency domain and contain 12 coefficients (each coefficient is 12-bit long). These 12 coefficients are used to implement either a symmetric 24-tap (even-tap) filter, or a symmetric 23-tap (odd-tap) filter. Setting the register bit ODD_TAP1 to '1' enables the odd-tap configuration (the default is even tap with this bit set to '0') for Channel 1. The bits FILTER1_COEFF_SET<2:0> can be used to choose the required set of coefficients for Channel 1.

The passbands corresponding to of each of these filter coefficient sets is shown in [Figure 50](#)

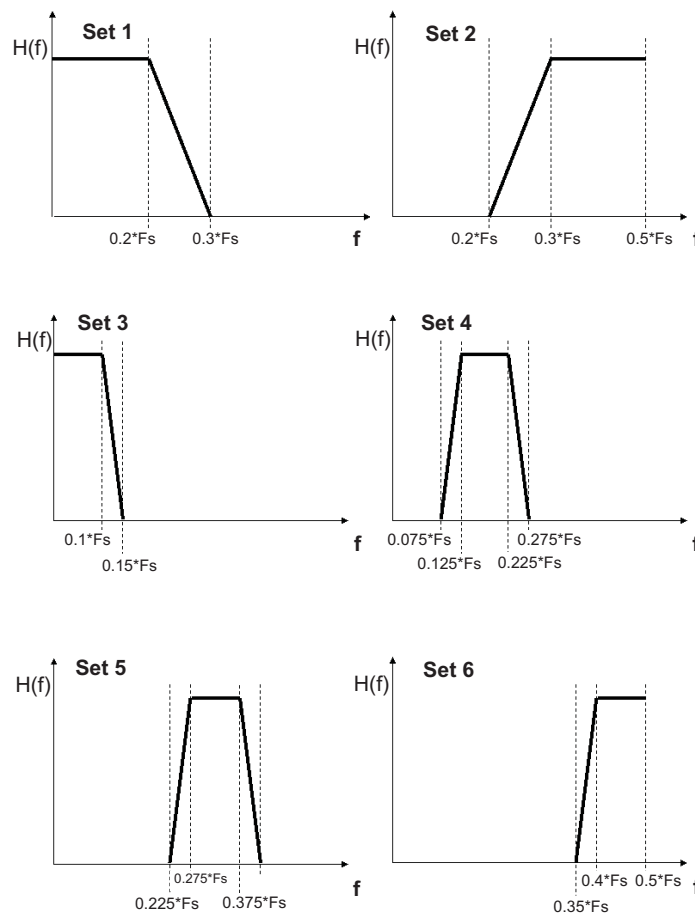

Figure 50. Filter Types

Coefficient Sets 1 and 2 are the most appropriate when Decimation by a factor of 2 is required, whereas Coefficient Sets 3,4,5,6 are appropriate when Decimation by a factor of 4 is desired. The computation rate of the filter output can be independently set using the bits FILTERn_RATE<2:0>. The settings are shown in [Table 5](#).

Table 5. Digital Filters

| DECIMATION | TYPE OF FILTER | <DATA RATE> | FILTERn RATE> | <FILTERn COEFF SET> | <ODD TAP> | <USE FILTER CHn> | <EN CUSTOM FILT> |
|-------------------|--|-------------|---------------|---------------------|-----------|------------------|------------------|
| Decimate by 2 | Built-in low-pass odd-tap filter (pass band = 0 to $f_s/4$) | 001 | 000 | 000 | 1 | 1 | 0 |
| | Built-in high-pass odd-tap filter (pass band = 0 to $f_s/4$) | 001 | 000 | 001 | 1 | 1 | 0 |
| Decimate by 4 | Built-in low-pass even-tap filter (pass band = 0 to $f_s/8$) | 010 | 001 | 010 | 0 | 1 | 0 |
| | Built-in first band pass even tap filter (pass band = $f_s/8$ to $f_s/4$) | 010 | 001 | 011 | 0 | 1 | 0 |
| | Built-in second band pass even tap filter (pass band = $f_s/4$ to $3 f_s/8$) | 010 | 001 | 100 | 0 | 1 | 0 |
| | Built-in high pass odd tap filter (pass band = $3 f_s/8$ to $f_s/2$) | 010 | 001 | 101 | 1 | 1 | 0 |
| Decimate by 2 | Custom filter (user programmable coefficients) | 001 | 000 | 000 | 0 and 1 | 1 | 1 |
| Decimate by 4 | Custom filter (user programmable coefficients) | 010 | 001 | 000 | 0 and 1 | 1 | 1 |
| Decimate by 8 | Custom filter (user programmable coefficients) | 011 | 100 | 000 | 0 and 1 | 1 | 1 |
| Bypass decimation | Custom filter (user programmable coefficients) | | | | 0 and 1 | 1 | 1 |

The choice of the odd/even tap setting, filter coefficient set and the filter rate uniquely determines the filter to be used. In addition to the preset filter coefficients, the coefficients for each of the eight filter channels can be programmed by the user. Each of the eight channels has 12 programmable coefficients, each 12-bit long. The 96 registers with addresses from 5A (Hex) to B9 (Hex) are used to program these 8 sets of 12 programmable coefficients. Registers 5A to 65 are used to program the 1st filter, with the 1st coefficient occupying the bits D11..D0 of register 5A, the 2nd coefficient occupying the bits D11..D0 of register 5B, and so on. Similarly registers 66(Hex) to 71(Hex) are used to program the 2nd filter, and so on.

When programming the filter coefficients, the D15 bit of each of the 12 registers corresponding to that filter should be set to '1'. If the D15 bit of these 12 registers is set to '0', then the preset coefficient (as programmed by FILTERn_COEFF_SET<2:0>) is used even if the bits D11..D0 get programmed. By setting or not setting the D15 bits of individual filter channels to '1', some filters can be made to operate with preset coefficient sets, and some others can be made to simultaneously operate with programmed coefficient sets.

HIGH PASS FILTER

Where k is set as described by the HPF_corner registers (one for each channel). Also the HPF_EN bit in each register needs to be set to enable the HPF feature for each channel.

BIT CLOCK PROGRAMMABILITY

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | NAME |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|----------------|
| 42 | | | | | | | | | | X | X | | | | | | PHASE_DDR<1:0> |
| 46 | 1 | | | | | | | | | | | X | | | | | EN_SDR |
| 46 | 1 | | X | | | | | | | | | | | | | | FALL_SDR |

The output interface of the ADS5294 is normally a DDR interface, with the LCLK rising edge and falling edge transitions in the middle of alternate data windows. This default phase is shown in [Figure 51](#).

Figure 51. Default Phase of LCLK

The phase of LCLK can be programmed relative to the output frame clock and data using bits PHASE_DDR<1:0>. The LCLK phase modes are shown in [Figure 52](#).

Figure 52. Phase Programmability Modes for LCLK

In addition to programming the phase of the LCLK in the DDR mode, the device can also be made to operate in SDR mode by setting bit EN_SDR to 1. In the mode, the bit clock (LCLK) is output at 14X times the input clock, or twice the rate as in DDR mode. Depending on the state of FALL_SDR, the LCLK may be output in either of the two manners shown in Figure 53. As can be seen in Figure 53, only the LCLK rising (or falling edge) is used to capture the output data in SDR mode. The SDR mode does not work well beyond 40 MSPS because the LCLK frequency will become very high.

Figure 53. SDR Interface Modes

OUTPUT DATA RATE CONTROL

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|--------------|--------------|
| 38 | | | | | | | | | | | | | | | DATA_RATE<1> | DATA_RATE<0> |

In the default mode of operation, the data rate at the output of the ADS5294 is at the sampling rate of the ADC. This is true even when the custom pattern generator is enabled. In addition, both output data rate and sampling rate can also be configured to a sub-multiple of the input clock rate.

With the DATA_RATE<1:0> control, the output data rate can be programmed to be a sub-multiple of the ADC sampling rate. This feature can be used to lower the output data rate, for example when the decimation filter is used. Without enabling the decimation filter, the sub-multiple ADC sampling rate feature still can be used.

The different settings are listed below:

| DATA_RATE<1> | DATA_RATE<0> | Output data rate |
|--------------|--------------|---------------------------|
| 0 | 0 | Same as ADC sampling rate |
| 0 | 1 | 1/2 of ADC sampling rate |
| 1 | 0 | 1/4 of ADC sampling rate |
| 1 | 1 | 1/8 of ADC sampling rate |

SYNCHRONIZATION PULSE

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|----------------|--------------|-----|---------|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 25 | TP_HARD_SYNC | | | | | | | | | | | | | | | |
| 02 | | | EN_SYNC | | | | | | | | | | | | | |

The SYNC pin can be used to synchronize the data output from channels within the same chip or from channels across chips when decimation filters are used with reduced output data rate.

When the decimation filters are used (for example, the decimate by two filter is enabled), then, effectively, the device outputs one digital code for every two analog input samples. If the SYNC function is not enabled, then the filters are not synchronized (even within a chip) – this means that one channel may be sending out codes corresponding to input samples N, N+1 and so on, while another may be sending out code corresponding to N+1, N+2 and so on.

To achieve synchronization, the SYNC pulse must arrive at all the ADS529x chips at the same time instant (as shown in the timing diagram of [Figure 54](#)

The ADS5294 generates an internal synchronization signal which is used to reset the internal clock dividers used by the decimation filter.

Using the SYNC signal in this way ensures that all channels will output digital codes corresponding to the same set of input samples.

SYNC Timings:

Synchronizing the filters using the SYNC pin is enabled by default. No register bits are required to be written. Even EN_SYNC bit is not required. It is important for register bit TP_HARD_SYNC to be 0 for this mode to work. As shown by [Figure 54](#), the SYNC rising edge can be positioned anywhere within the window. The width of the SYNC must be at least one clock cycle.

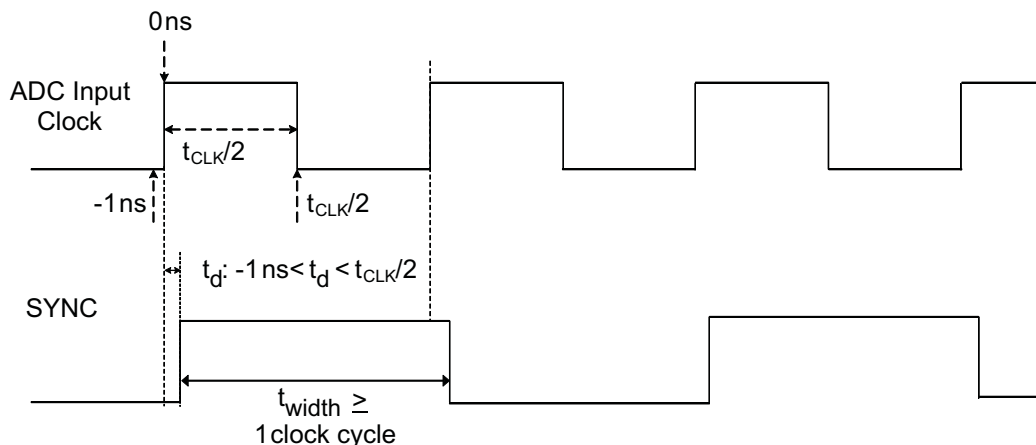

Figure 54. Synchronization Pulse Timing

Note that the SYNC DOES NOT synchronize the sampling instants of the ADC across chips. All channels within a single chip sample their analog inputs simultaneously. To ensure that channels across two chips will sample their analog inputs simultaneously, the input clock needs to be routed to both chips with identical length. This ensuring that the input clocks arrive at both the chips at the same time. This needs to be taken care of in the board design and routing. The SYNC pin cannot be used to synchronize the sampling instants.

In addition to the above, the SYNC can also be used to synchronize the RAMP test patterns across channels. In order to synchronize the test patterns, TP_HARD_SYNC must be set as 1. Setting TP_HARD_SYNC =1 actually disables the sync of the filters.

External Reference Mode of Operation

The ADS5294 supports an external reference mode of operation in one of two ways:

- a. By forcing the reference voltages on the REFT and REFB pins.
- b. By applying the reference voltage on VCM pin.

This mode can be used to operate multiple ADS5294 chips with the same (externally applied) reference voltage.

Using the REF pins:

For normal operation, the device requires two reference voltages, REFT and REFB. By default, the device generates these two voltages internally. To enable the external reference mode, set the register bits as shown in [Table 6](#). This powers down the internal reference amplifier and the two reference voltages can be forced directly on the REFT and REFB pins as $V_{REFT} = 1.45V \pm 50mV$ and $V_{REFB} = 0.45V \pm 50mV$.

Note that the relation between the ADC full-scale input voltage and the applied reference voltages is

$$\text{Full-scale input voltage} = 2 \times (V_{REFT} - V_{REFB}) \quad (4)$$

Using the VCM pin:

In this mode, an external reference voltage V_{REFIN} can be applied to the VCM pin such that

$$\text{Full-scale input voltage} = 2 \times V_{REFIN} \quad (5)$$

To enable this mode, set the register bits as shown in [Table 6](#). This changes the function of the VCM pin to an external reference input pin. The voltage applied on VCM must be $1.5V \pm 50mV$.

Table 6. External reference function

| Function | EN_HIGH_ADDR5 | EN_EXT_REF | EXT_REF_VCM |
|---|---------------|------------|-------------|
| External reference using REFT/REFB pins | 1 | 1 | 00 |
| External reference using VCM pin | 1 | 1 | 11 |

DATA OUTPUT FORMAT MODES

| ADDR. (HEX) | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | NAME |
|-------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|-----------|
| 46 | 1 | | | | | | | | | | | | | X | | | BTC_MODE |
| 46 | 1 | | | | | | | | | | | | X | | | | MSB_FIRST |

The ADC output, by default, is in Straight offset binary mode. Programming the BTC_MODE bit to '1' inverts the MSB, and the output becomes Binary 2's complement mode. Also, by default, the first bit of the frame (following the rising edge of CLKP) is the LSB of the ADC output. Programming the MSB_FIRST mode inverts the bit order in the word, and the MSB is output as the first bit following CLKP rising edge.

The ADS5294 has 16 pairs of LVDS channel outputs. The mapping of ADC channels to LVDS output channels is programmable to allow for flexibility in board layout. The 16 LVDS channel outputs are split in to 2 groups of 8 LVDS pairs. Within each group 4 ADC input channels can be multiplexed in to the 8 LVDS pairs depending on the modes of operation whether it is 1 wire mode or 2 wire mode.

Input channels 1 to 4 can be mapped to any of the LVDS outputs OUT1A/B to OUT4A/B (using the MAP_CH1234_TO_OUTnA/B). Similarly, input channels 5 to 8 can be mapped to any of the LVDS outputs OUT5A/B to OUT8A/B (using the MAP_CH5678_TO_OUTnA/B). The block diagram of the mapping is listed in [Figure 55](#).

Figure 55. Input and Output Channel Mapping

ADS5294

SLAS776B – NOVEMBER 2011 – REVISED JULY 2012

www.ti.com

Registers 0x50 to 0x55 control the multiplexing options as below:

| MAP_CH1234_to_OUTn<3:0> | Mapping | Used in 1-wire mode? | Used in 2-wire mode? |
|-------------------------|---|----------------------|----------------------|
| 0000 | ADC input channel IN1 to OUTn | Y | Y, for LSB byte |
| 0001 | ADC input channel IN1 to OUTn (2-wire only) | N | Y, for MSB byte |
| 0010 | ADC input channel IN2 to OUTn | Y | Y, for LSB byte |
| 0011 | ADC input channel IN2 to OUTn (2-wire only) | N | Y, for MSB byte |
| 0100 | ADC input channel IN3 to OUTn | Y | Y, for LSB byte |
| 0101 | ADC input channel IN3 to OUTn (2-wire only) | N | Y, for MSB byte |
| 0110 | ADC input channel IN4 to OUTn | Y | Y, for LSB byte |
| 0111 | ADC input channel IN4 to OUTn (2-wire only) | N | Y, for MSB byte |
| 1xxx | LVDS output buffer OUTn is powered down | | |

| MAP_CH5678_to_OUTn<3:0> | Mapping | Used in 1-wire mode? | Used in 2-wire mode? |
|-------------------------|---|----------------------|----------------------|
| 0000 | ADC input channel IN8 to OUTn | Y | Y, for LSB byte |
| 0001 | ADC input channel IN8 to OUTn (2-wire only) | N | Y, for MSB byte |
| 0010 | ADC input channel IN7 to OUTn | Y | Y, for LSB byte |
| 0011 | ADC input channel IN7 to OUTn (2-wire only) | N | Y, for MSB byte |
| 0100 | ADC input channel IN6 to OUTn | Y | Y, for LSB byte |
| 0101 | ADC input channel IN6 to OUTn (2-wire only) | N | Y, for MSB byte |
| 0110 | ADC input channel IN5 to OUTn | Y | Y, for LSB byte |
| 0111 | ADC input channel IN5 to OUTn (2-wire only) | N | Y, for MSB byte |
| 1xxx | LVDS output buffer OUTn is powered down | | |

The default mapping for 1-wire and 2-wire modes is:

Table 7. Mapping for 1-wire Mode

| Analog Input channel | LVDS Output |
|----------------------|-------------|
| Channel IN1 | OUT1A |
| Channel IN2 | OUT2A |
| Channel IN3 | OUT3A |
| Channel IN4 | OUT4A |
| Channel IN5 | OUT5A |
| Channel IN6 | OUT6A |
| Channel IN7 | OUT7A |
| Channel IN8 | OUT8A |

Note: In the single wire mode with default register settings, ADC data is available only on OUTnA.

Table 8. Mapping for 2-wire Mode

| Analog Input channel | LVDS Output |
|----------------------|--------------|
| Channel IN1 | OUT1A, OUT1B |
| Channel IN2 | OUT2A, OUT2B |
| Channel IN3 | OUT3A, OUT3B |
| Channel IN4 | OUT4A, OUT4B |
| Channel IN5 | OUT5A, OUT5B |
| Channel IN6 | OUT6A, OUT6B |
| Channel IN7 | OUT7A, OUT7B |
| Channel IN8 | OUT8A, OUT8B |

Note: In the 2-wire mode, the ADC data is available on both OUTnA and OUTnB.

APPLICATION INFORMATION

THEORY OF OPERATION

The ADS5294 is an octal channel, 14-bit high-speed ADC with sample rate up to 80 MSPS that runs off a single 1.8 V supply. All eight channels of the ADS5294 simultaneously sample their analog inputs at the rising edge of the input clock. The sampled signal is sequentially converted by a series of small resolution stages, with the outputs combined in a digital correction logic block. At every clock, edge the sample propagates through the pipeline resulting in a data latency of 11 clock cycles.

The 14 data bits of each channel are serialized and sent out in either 1-wire (one pair of LVDS pins are used) or 2-wire (two pairs of LVDS pins are used) mode, depending on the LVDS output rate. When the data is output in the 2-wire mode, it can reduce the serial data rate of the outputs, especially at higher sampling rates. Hence, low cost FPGAs can be used to capture 80 MSPS/14bit data. Alternately, at lower sample rates, the 14-bit data can be output as a single data stream over one pair of LVDS pins (1-wire mode). The device outputs a bit clock at 7x and frame clock at 1x times the sample frequency in the 14-bit mode.

This 14-bit ADC achieves approximately 76 dBFS SNR at 80 MSPS. Its output resolution can be configured as 12-bit and 10-bit if necessary. 70 dBFS and 61 dBFS SNRs are achieved when the ADS5294's output resolution is 12-bit and 10-bit respectively.

ANALOG INPUT

The analog inputs consist of a switched-capacitor based, differential sample and hold architecture. This differential topology results in very good AC performance even for high input frequencies at high sampling rates. The INP and INM pins are internally biased around a common-mode voltage of V_{cm} (0.95 V). For a full-scale differential input, each input pin (INP and INM) must swing symmetrically between $V_{cm} + 0.5V$ and $V_{cm} - 0.5V$, resulting in a $2 V_{pp}$ differential input swing. [Figure 56](#) illustrates the equivalent circuit of the input sampling circuit.

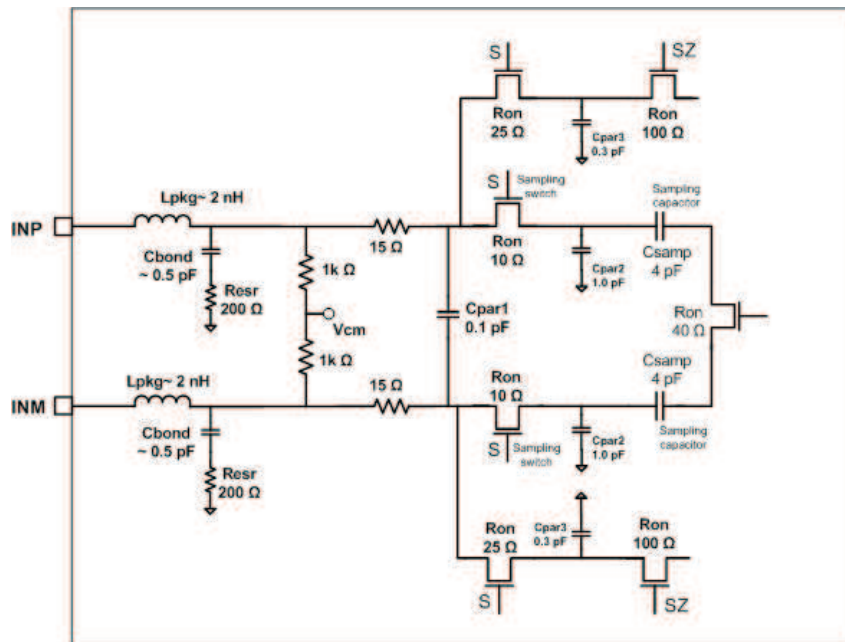

Figure 56. Analog Input Circuit Model

DRIVE CIRCUIT

For optimum performance, the analog inputs must be driven differentially. This improves the common-mode noise immunity and even order harmonic rejection. A 5 Ω to 15 Ω resistor in series with each input pin is recommended to damp out ringing caused by package parasitic.

The drive circuit shows an R-C filter across the analog input pins. The purpose of the filter is to absorb the glitches caused by the opening and closing of the sampling capacitors.

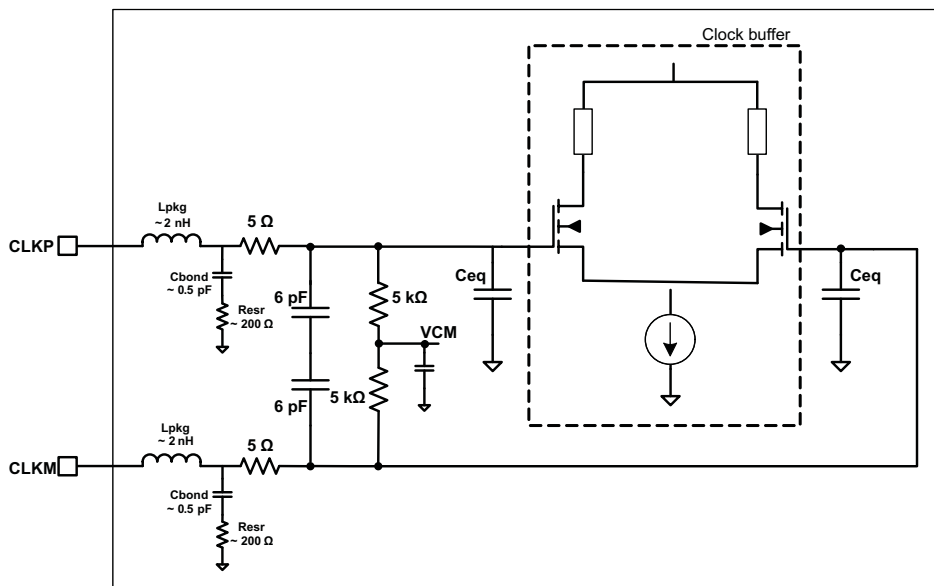

Figure 57. Analog Input Drive Circuit

Large and Small Signal Input Bandwidth

The small signal bandwidth of the analog input circuit is high, around 550 MHz. When using an amplifier to drive the ADS5294, the total noise of the amplifier up to the small signal bandwidth must be considered. The large signal bandwidth of the device depends on the amplitude of the input signal. The ADS5294 supports $2 V_{PP}$ amplitude for input signal frequency up to 80 MHz. For higher frequencies (80 MHz), the amplitude of the input signal must be decreased proportionally. For example, at 160 MHz, the device supports a maximum of $1 V_{PP}$ signal.

INPUT CLOCK

The ADS5294 is configured by default to operate with a single-ended input clock – CLKP is driven by a CMOS clock and CLKM is tied to GND. The device can automatically detect a single-ended or differential clock. If CLKM is grounded, the device treats clock as a single-ended clock. Operating with a low-jitter differential clock usually gives better SNR performance, especially at input frequencies greater than 30 MHz. Typical clock termination structures are listed in Figure 58 and Figure 59.

Ceq is approximately 1 to 3 pF, equivalent input capacitance of clock buffer.

Figure 58. Equivalent Circuit of the Input Clock Circuit

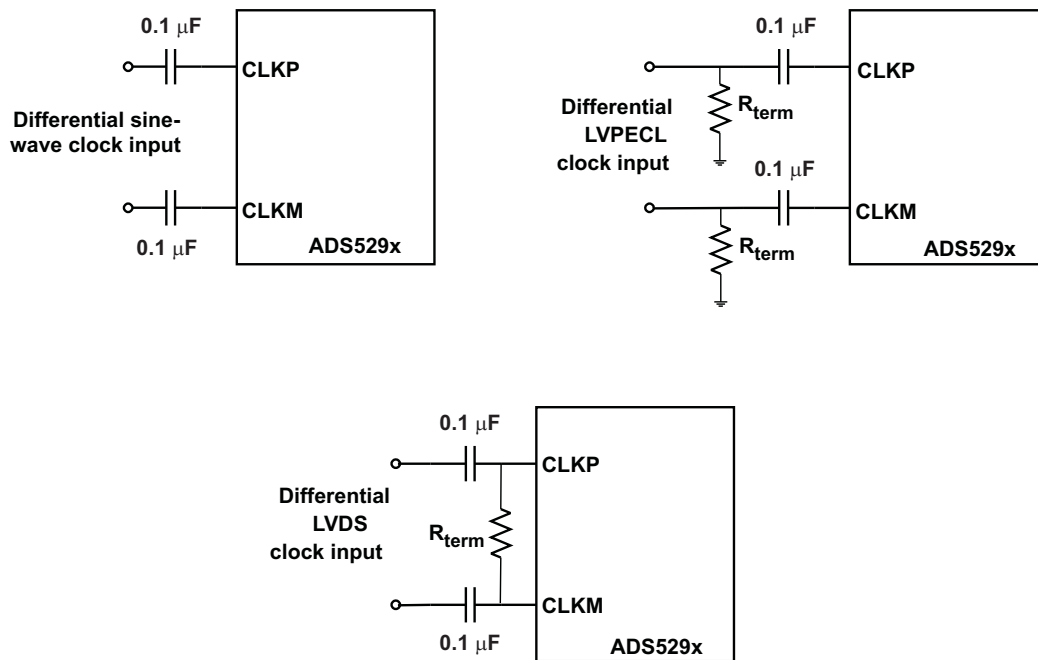

SINGLE-ENDED CLOCK CONNECTIONS

DIFFERENTIAL CLOCK CONNECTIONS

DIFFERENTIAL CLOCK CONNECTIONS

DIGITAL HIGH PASS IIR FILTER

DC offset is often observed at ADC input signals. For example, in ultrasound applications, the DC offset from VGA (variable Gain amplifier) varies at different gains. Such a variable offset can introduce artifacts in ultrasound images especially in Doppler modes. Analog filter between ADC and VGA can be used with added noise and power. Digital filter achieves the same performance as analog filters and has more flexibility in fine tuning multiple characteristics.

ADS5294 includes optional 1st order digital high-pass IIR filter. Its block diagram is shown in Figure 60 as well as its transfer function

$$y(n) = \frac{2^k}{2^k+1} [x(n) - x(n-1) + y(n-1)] \tag{6}$$

Figure 60. HP Filter Block Diagram

Figure 61 shows its characteristics at k=2 to 10.

Figure 61. HP Filter Amplitude Response at K = 2 to 10

DECIMATION FILTER

ADS5294 includes an option to decimate the ADC output data using filters. Once the decimation is enabled, the decimation rate, frequency band of the filter can be programmed. In addition, the user can select either the pre-defined or custom coefficients.

Table 9. Digital Filters

| DECIMATION | TYPE OF FILTER | <DATA RATE> | FILTERn RATE> | <FILTERn COEFF SET> | <ODD TAP> | <USE FILTER CHn> | <EN CUSTOM FILT> |
|-------------------|--|-------------|---------------|---------------------|-----------|------------------|------------------|
| Decimate by 2 | Built-in low-pass odd-tap filter (pass band = 0 to $f_s/4$) | 001 | 000 | 000 | 1 | 1 | 0 |
| | Built-in high-pass odd-tap filter (pass band = 0 to $f_s/4$) | 001 | 000 | 001 | 1 | 1 | 0 |
| Decimate by 4 | Built-in low-pass even-tap filter (pass band = 0 to $f_s/8$) | 010 | 001 | 010 | 0 | 1 | 0 |
| | Built-in first band pass even tap filter (pass band = $f_s/8$ to $f_s/4$) | 010 | 001 | 011 | 0 | 1 | 0 |
| | Built-in second band pass even tap filter (pass band = $f_s/4$ to $3 f_s/8$) | 010 | 001 | 100 | 0 | 1 | 0 |
| | Built-in high pass odd tap filter (pass band = $3 f_s/8$ to $f_s/2$) | 010 | 001 | 101 | 1 | 1 | 0 |
| Decimate by 2 | Custom filter (user programmable coefficients) | 001 | 000 | 000 | 0 and 1 | 1 | 1 |
| Decimate by 4 | Custom filter (user programmable coefficients) | 010 | 001 | 000 | 0 and 1 | 1 | 1 |
| Decimate by 8 | Custom filter (user programmable coefficients) | 011 | 100 | 000 | 0 and 1 | 1 | 1 |
| Bypass decimation | Custom filter (user programmable coefficients) | | | | 0 and 1 | 1 | 1 |

DECIMATION FILTER EQUATION

In the default setting, the decimation filter is implemented as a 24-tap FIR filter with symmetrical coefficients (each coefficient is 12-bit signed). By setting the register bit <ODD TAPn> = 1, a 23-tap FIR is implemented

Pre-defined Coefficients

The build-in filters (low pass, high pass and band pass) use pre-defined coefficients. The frequency responses of the build-in decimation filters with different decimation factors are shown in [Figure 62](#).

Figure 62. Decimation Filter Responses (Decimate by 2)

Figure 63. Decimation Filter Responses (Decimate by 4)

Custom Filter Coefficients

The filter coefficients can also be programmed by the user (customized). For custom coefficients, set the register bit **<FILTER COEFF SELECT>** and load the coefficients (h_0 to h_{11}) in registers 0x5A to 0xB9, using the serial interface as:

Register content = real coefficient value x 211, i.e., 12 bit signed representation of real coefficient.

Board Design Considerations

Grounding

A single ground plane is sufficient to give good performance, provided the analog, digital, and clock sections of the board are cleanly partitioned. See *ADS5294VM Evaluation Module (SLAU355)* for placement of components, routing and grounding.

Supply Decoupling

Because the ADS5294 already includes internal decoupling, minimal external decoupling can be used without loss in performance. For example, the ADS5294EVM uses a single 0.1 μ F decoupling capacitor for each supply, placed close to the device supply pins.

Packaging

Exposed Pad

The exposed pad at the bottom of the package is the main path for heat dissipation. Therefore, the pad must be soldered to a ground plane on the PCB for best thermal performance. The pad must be connected to the ground plane through the optimum number of vias.

Also, visit TI's thermal website at www.ti.com/thermal.

DEFINITION OF SPECIFICATIONS

Analog Bandwidth – The analog input frequency at which the power of the fundamental is reduced by 3 dB with respect to the low-frequency value.

Aperture Delay – The delay in time between the rising edge of the input sampling clock and the actual time at which the sampling occurs. This delay is different across channels. The maximum variation is specified as aperture delay variation (channel-to-channel).

Aperture Uncertainty (Jitter) – The sample-to-sample variation in aperture delay.

Clock Pulse Width/Duty Cycle – The duty cycle of a clock signal is the ratio of the time the clock signal remains at a logic high (clock pulse width) to the period of the clock signal. Duty cycle is typically expressed as a percentage. A perfect differential sine-wave clock results in a 50% duty cycle.

Maximum Conversion Rate – The maximum sampling rate at which specified operation is given. All parametric testing is performed at this sampling rate unless otherwise noted.

Minimum Conversion Rate – The minimum sampling rate at which the ADC functions.

Differential Nonlinearity (DNL) – An ideal ADC exhibits code transitions at analog input values spaced exactly 1 LSB apart. The DNL is the deviation of any single step from this ideal value, measured in units of LSBs.

Integral Nonlinearity (INL) – The INL is the deviation of the ADC transfer function from a best fit line determined by a least squares curve fit of that transfer function, measured in units of LSBs.

Gain Error – Gain error is the deviation of the ADC actual input full-scale range from its ideal value. The gain error is given as a percentage of the ideal input full-scale range. Gain error has two components: error as a result of reference inaccuracy and error as a result of the channel. Both errors are specified independently as E_{GREF} and E_{GCHAN} .

To a first-order approximation, the total gain error is $E_{TOTAL} \sim E_{GREF} + E_{GCHAN}$.

For example, if $E_{TOTAL} = \pm 0.5\%$, the full-scale input varies from $(1 - 0.5/100) \times FS_{ideal}$ to $(1 + 0.5/100) \times FS_{ideal}$.

Offset Error – The offset error is the difference, given in number of LSBs, between the ADC actual average idle channel output code and the ideal average idle channel output code. This quantity is often mapped into millivolts.

Temperature Drift – The temperature drift coefficient (with respect to gain error and offset error) specifies the change per degree Celsius of the parameter from T_{MIN} to T_{MAX} . It is calculated by dividing the maximum deviation of the parameter across the T_{MIN} to T_{MAX} range by the difference $T_{MAX} - T_{MIN}$.

Signal-to-Noise Ratio – SNR is the ratio of the power of the fundamental (P_S) to the noise floor power (P_N), excluding the power at dc and the first nine harmonics.

$$SNR = 10 \log_{10} \frac{P_S}{P_N} \quad (7)$$

SNR is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

Signal-to-Noise and Distortion (SINAD) – SINAD is the ratio of the power of the fundamental (P_S) to the power of all the other spectral components including noise (P_N) and distortion (P_D), but excluding dc.

$$SINAD = 10 \log_{10} \frac{P_S}{P_N + P_D} \quad (8)$$

SINAD is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

Effective Number of Bits (ENOB) – ENOB is a measure of the converter performance as compared to the theoretical limit based on quantization noise.

$$\text{ENOB} = \frac{\text{SINAD} - 1.76}{6.02} \quad (9)$$

Total Harmonic Distortion (THD) – THD is the ratio of the power of the fundamental (P_S) to the power of the first nine harmonics (P_D).

$$\text{THD} = 10\text{Log}^{10} \frac{P_S}{P_N} \quad (10)$$

THD is typically given in units of dBc (dB to carrier).

Spurious-Free Dynamic Range (SFDR) – The ratio of the power of the fundamental to the highest other spectral component (either spur or harmonic). SFDR is typically given in units of dBc (dB to carrier).

Two-Tone Intermodulation Distortion – IMD3 is the ratio of the power of the fundamental (at frequencies f_1 and f_2) to the power of the worst spectral component at either frequency $2f_1 - f_2$ or $2f_2 - f_1$. IMD3 is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

DC Power-Supply Rejection Ratio (DC PSRR) – DC PSRR is the ratio of the change in offset error to a change in analog supply voltage. The dc PSRR is typically given in units of mV/V.

AC Power-Supply Rejection Ratio (AC PSRR) – AC PSRR is the measure of rejection of variations in the supply voltage by the ADC. If ΔV_{SUP} is the change in supply voltage and ΔV_{OUT} is the resultant change of the ADC output code (referred to the input), then:

$$\text{PSRR} = 20\text{Log}^{10} \frac{\Delta V_{\text{OUT}}}{\Delta V_{\text{SUP}}} \quad (\text{Expressed in dBc}) \quad (11)$$

Voltage Overload Recovery – The number of clock cycles taken to recover to less than 1% error after an overload on the analog inputs. This is tested by separately applying a sine wave signal with 6dB positive and negative overload. The deviation of the first few samples after the overload (from the expected values) is noted.

Common-Mode Rejection Ratio (CMRR) – CMRR is the measure of rejection of variation in the analog input common-mode by the ADC. If $\Delta V_{\text{CM_IN}}$ is the change in the common-mode voltage of the input pins and ΔV_{OUT} is the resulting change of the ADC output code (referred to the input), then:

$$\text{CMRR} = 20\text{Log}^{10} \frac{\Delta V_{\text{OUT}}}{\Delta V_{\text{CM}}} \quad (\text{Expressed in dBc}) \quad (12)$$

Crosstalk (only for multi-channel ADCs) – This is a measure of the internal coupling of a signal from an adjacent channel into the channel of interest. It is specified separately for coupling from the immediate neighboring channel (near-channel) and for coupling from channel across the package (far-channel). It is usually measured by applying a full-scale signal in the adjacent channel. Crosstalk is the ratio of the power of the coupling signal (as measured at the output of the channel of interest) to the power of the signal applied at the adjacent channel input. It is typically expressed in dBc.

REVISION HISTORY

Changes from Original (November 2011) to Revision A Page

- Changed From: Product Preview To: Production 1
-

Changes from Revision A (November 2011) to Revision B Page

- Changed the location of OUT A and OUT B in [Figure 5](#) and [Figure 6](#) 14
 - Added EN_HIGH_ADDRS to Table 3 29
 - Moved EN_EXT_REF From: 0x0F To: 0xF0 in Table 3 34
 - Added the section BIT-BYTE-WORD WISE OUTPUT. Added [Figure 47](#) and [Figure 48](#). 37
 - Added section DIGITAL PROCESSING BLOCKS 38
 - Replaced Table 5 and Table 6 with new [Table 5](#) - Digital Filters 43
 - Changed the SYNCHRONIZATION PULSE section 46
 - Added the External Reference Mode of Operation section 47
 - Added [Figure 58](#) 53
 - Replaced Table 9 (Decimation Filter Modes) with new [Table 9](#) - Digital Filters 56
 - Deleted section: Synchronization Pulse 57
-

PACKAGING INFORMATION

| Orderable Device | Status ⁽¹⁾ | Package Type | Package Drawing | Pins | Package Qty | Eco Plan ⁽²⁾ | Lead/ Ball Finish | MSL Peak Temp ⁽³⁾ | Samples (Requires Login) |
|------------------|-----------------------|--------------|-----------------|------|-------------|----------------------------|----------------------|------------------------------|-----------------------------|
| ADS5294IPFP | ACTIVE | HTQFP | PFP | 80 | 96 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | |
| ADS5294IPFPR | ACTIVE | HTQFP | PFP | 80 | 1000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | |
| ADS5294IPFPT | ACTIVE | HTQFP | PFP | 80 | 250 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | |

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

LAND PATTERN DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
