

## CY7C67200

# EZ-OTG<sup>™</sup> Programmable USB On-The-Go Host/Peripheral Controller

## **EZ-OTG Features**

- Single-chip programmable USB dual-role (Host/Peripheral) controller with two configurable Serial Interface Engines (SIEs) and two USB ports
- Supports USB OTG protocol
- On-chip 48-MHz 16-bit processor with dynamically switchable clock speed
- Configurable IO block supports a variety of IO options or up to 25 bits of General Purpose IO (GPIO)
- 4K × 16 internal mask ROM contains built-in BIOS that supports a communication-ready state with access to I<sup>2</sup>C<sup>™</sup> EEPROM interface, external ROM, UART, or USB
- 8K x 16 internal RAM for code and data buffering
- 16-bit parallel host port interface (HPI) with DMA/Mailbox data path for an external processor to directly access all on-chip memory and control on-chip SIEs
- Fast serial port supports from 9600 baud to 2.0M baud

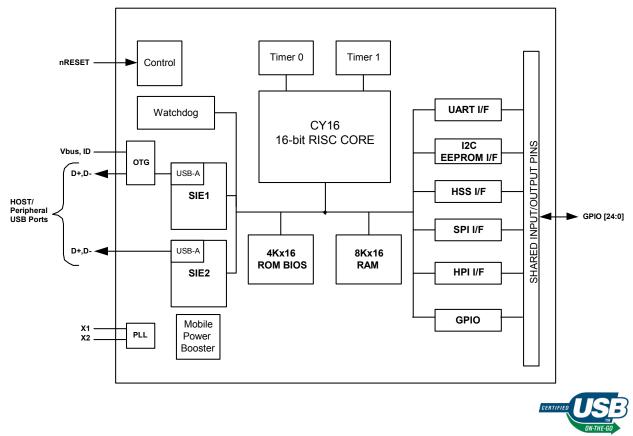

## Logic Block Diagram – CY7C67200

- SPI supports both master and slave
- Supports 12 MHz external crystal or clock
- 2.7 V to 3.6 V power supply voltage
- Package option: 48-pin FBGA

## **Typical Applications**

EZ-OTG is a very powerful and flexible dual-role USB controller that supports a wide variety of applications. It is primarily intended to enable USB OTG capability in applications such as:

- Cellular phones
- PDAs and pocket PCs
- Video and digital still cameras
- MP3 players
- Mass storage devices

## Introduction

EZ-OTG<sup>™</sup> (CY7C67200) is Cypress Semiconductor's first USB On-The-Go (OTG) host/peripheral controller. EZ-OTG is designed to easily interface to most high-performance CPUs to add USB host functionality. EZ-OTG has its own 16-bit RISC processor to act as a coprocessor or operate in standalone mode. EZ-OTG also has a programmable IO interface block allowing a wide range of interface options.

## **Processor Core Functional Overview**

An overview of the processor core components are presented in this section.

## Processor

EZ-OTG has a general purpose 16-bit embedded RISC processor that runs at 48 MHz.

## Clocking

EZ-OTG requires a 12 MHz source for clocking. Either an external crystal or TTL-level oscillator may be used. EZ-OTG has an internal PLL that produces a 48 MHz internal clock from the 12 MHz source.

## Memory

EZ-OTG has a built-in  $4K \times 16$  masked ROM and an  $8K \times 16$  internal RAM. The masked ROM contains the EZ-OTG BIOS. The internal RAM can be used for program code or data.

## Interrupts

EZ-OTG provides 128 interrupt vectors. The first 48 vectors are hardware interrupts and the following 80 vectors are software interrupts.

## **General Timers and Watchdog Timer**

EZ-OTG has two built-in programmable timers and a watchdog timer. All three timers can generate an interrupt to the EZ-OTG.

## **Power Management**

EZ-OTG has one main power-saving mode, Sleep. Sleep mode pauses all operations and provides the lowest power state.

## Interface Descriptions

EZ-OTG has a variety of interface options for connectivity, with several interface options available. See Table 1 to understand how the interfaces share pins and can coexist. Below are some general guidelines:

- I2C EEPROM and OTG do not conflict with any interfaces
- HPI is mutually exclusive to HSS, SPI, and UART

| GPIO Pins | HPI | HSS | SPI  | UART | I2C     | OTG   |
|-----------|-----|-----|------|------|---------|-------|
| GPIO31    |     |     |      |      | SCL/SDA |       |
| GPIO30    |     |     |      |      | SCL/SDA |       |
| GPIO29    |     |     |      |      |         | OTGID |
| GPIO24    | INT |     |      |      |         |       |
| GPIO23    | nRD |     |      |      |         |       |
| GPIO22    | nWR |     |      |      |         |       |
| GPIO21    | nCS |     |      |      |         |       |
| GPIO20    | A1  |     |      |      |         |       |
| GPIO19    | A0  |     |      |      |         |       |
| GPIO15    | D15 | CTS |      |      |         |       |
| GPIO14    | D14 | RTS |      |      |         |       |
| GPIO13    | D13 | RXD |      |      |         |       |
| GPIO12    | D12 | TXD |      |      |         |       |
| GPIO11    | D11 |     | MOSI |      |         |       |
| GPIO10    | D10 |     | SCK  |      |         |       |
| GPIO9     | D9  |     | nSSI |      |         |       |
| GPIO8     | D8  |     | MISO |      |         |       |
| GPIO7     | D7  |     |      | TX   |         |       |
| GPIO6     | D6  |     |      | RX   |         |       |
| GPIO5     | D5  |     |      |      |         |       |
| GPIO4     | D4  |     |      |      |         |       |
| GPIO3     | D3  |     |      |      |         |       |
| GPIO2     | D2  |     |      |      |         |       |
| GPIO1     | D1  |     |      |      |         |       |
| GPIO0     | D0  |     |      |      |         |       |

## Table 1. Interface Options for GPIO Pins

## **USB** Interface

EZ-OTG has two built-in Host/Peripheral SIEs that each have a single USB transceiver, meeting the USB 2.0 specification requirements for full and low speed (high speed is not supported). In Host mode, EZ-OTG supports two downstream ports; each supports control, interrupt, bulk, and isochronous transfers. In Peripheral mode, EZ-OTG supports one peripheral port with eight endpoints for each of the two SIEs. Endpoint 0 is dedicated as the control endpoint and only supports control transfers. Endpoints 1 though 7 support Interrupt, bulk (up to 64 bytes per packet), or isochronous transfers (up to 1023 bytes per packet size). EZ-OTG also supports a combination of Host and Peripheral ports simultaneously, as shown in Table 2.

| Port Configurations   | Port 1A    | Port 2A    |
|-----------------------|------------|------------|
| OTG                   | OTG        | -          |
| OTG + 1 Host          | OTG        | Host       |
| OTG + 1 Peripheral    | OTG        | Peripheral |
| 1 Host + 1 Peripheral | Host       | Peripheral |
| 1 Host + 1 Peripheral | Peripheral | Host       |
| 2 Hosts               | Host       | Host       |
| 1 Host                | Host       | -          |
| 1 Host                | -          | Host       |
| 2 Peripherals         | Peripheral | Peripheral |
| 1 Peripheral          | Peripheral | -          |
| 1 Peripheral          | _          | Peripheral |

### Table 2. USB Port Configuration Options

## USB Features

- USB 2.0 compatible for full and low speed
- Up to two downstream USB host ports
- Up to two upstream USB peripheral ports
- Configurable endpoint buffers (pointer and length), must reside in internal RAM
- Up to eight available peripheral endpoints (1 control endpoint)
- Supports Control, Interrupt, Bulk, and Isochronous transfers
- Internal DMA channels for each endpoint
- Internal pull up and pull down resistors
- Internal Series termination resistors on USB data lines

#### USB Pins

#### Table 3. USB Interface Pins

| Pin Name | Pin Number |
|----------|------------|
| DM1A     | F2         |
| DP1A     | E3         |
| DM2A     | C2         |
| DP2A     | D3         |

## **OTG Interface**

EZ-OTG has one USB port that is compatible with the USB On-The-Go supplement to the USB 2.0 specification. The USB OTG port has various hardware features to support Session Request Protocol (SRP) and Host Negotiation Protocol (HNP). OTG is only supported on USB PORT 1A.

#### OTG Features

- Internal Charge Pump to supply and control VBUS
- VBUS Valid Status (above 4.4 V)
- VBUS Status for 2.4 V < VBUS < 0.8 V
- ID Pin Status
- Switchable 2-Kohm internal discharge resistor on VBUS
- Switchable 500-ohm internal pull-up resistor on VBUS
- Individually switchable internal pull-up and pull-down resistors on the USB data lines

#### OTG Pins

#### Table 4. OTG Interface Pins

| Pin Name | Pin Number |
|----------|------------|
| DM1A     | F2         |
| DP1A     | E3         |
| OTGVBUS  | C1         |
| OTGID    | F4         |
| CSwitchA | D1         |
| CSwitchB | D2         |

## **General Purpose IO Interface**

EZ-OTG has up to 25 GPIO signals available. Several other optional interfaces use GPIO pins as well and may reduce the overall number of available GPIOs.

## **GPIO** Description

All Inputs are sampled asynchronously with state changes occurring at a rate of up to two 48 MHz clock cycles. GPIO pins are latched directly into registers, a single flip-flop.

#### Unused Pin Descriptions

Unused USB pins must be tri-stated with the D+ line pulled high through the internal pull-up resistor and the D– line pulled low through the internal pull-down resistor.

Unused GPIO pins must be configured as outputs and driven low.

## **UART Interface**

EZ-OTG has a built-in UART interface. The UART interface supports data rates from 900 to 115.2K baud. It can be used as a development port or for other interface requirements. The UART interface is exposed through GPIO pins.

## UART Features

- Supports baud rates of 900 to 115.2K
- 8-N-1

## UART Pins

## Table 5. UART Interface Pins

| Pin Name | Pin Number |
|----------|------------|
| TX       | B5         |
| RX       | B4         |

## I<sup>2</sup>C EEPROM Interface

EZ-OTG provides a master-only I2C interface for external serial EEPROMs. The serial EEPROM can be used to store application-specific code and data. This I2C interface is only to be used for loading code out of EEPROM, it is not a general I2C interface. The I2C EEPROM interface is a BIOS implementation and is exposed through GPIO pins. Refer to the BIOS documentation for additional details on this interface.

## I<sup>2</sup>C EEPROM Features

- Supports EEPROMs up to 64 KB (512K bit)
- Auto-detection of EEPROM size

## I<sup>2</sup>C EEPROM Pins

## Table 6. I<sup>2</sup>C EEPROM Interface Pins

| Pin Name     | Pin Number |  |  |
|--------------|------------|--|--|
| SMALL EEPROM |            |  |  |
| SCK          | H3         |  |  |
| SDA          | F3         |  |  |
| LARGE EEPROM |            |  |  |
| SCK          | F3         |  |  |
| SDA          | H3         |  |  |

## **Serial Peripheral Interface**

EZ-OTG provides an SPI interface for added connectivity. EZ-OTG may be configured as either an SPI master or SPI slave. The SPI interface can be exposed through GPIO pins or the External Memory port.

## SPI Features

- Master or slave mode operation
- DMA block transfer and PIO byte transfer modes
- Full duplex or half duplex data communication
- 8-byte receive FIFO and 8-byte transmit FIFO
- Selectable master SPI clock rates from 250 kHz to 12 MHz
- Selectable master SPI clock phase and polarity

- Slave SPI signaling synchronization and filtering
- Slave SPI clock rates up to 2 MHz
- Maskable interrupts for block and byte transfer modes
- Individual bit transfer for non-byte aligned serial communication in PIO mode
- Programmable delay timing for the active/inactive master SPI clock
- Auto or manual control for master mode slave select signal
- Complete access to internal memory

## SPI Pins

The SPI port has a few different pin location options as shown in Table 7. The pin location is selectable via the GPIO Control register [0xC006].

## Table 7. SPI Interface Pins

| Pin Name | Pin Number |
|----------|------------|
| nSSI     | F6 or C6   |
| SCK      | D5         |
| MOSI     | D4         |
| MISO     | C5         |

## **High-Speed Serial Interface**

EZ-OTG provides an HSS interface. The HSS interface is a programmable serial connection with baud rate from 9600 baud to 2M baud. The HSS interface supports both byte and block mode operations as well as hardware and software handshaking. Complete control of EZ-OTG can be accomplished through this interface via an extensible API and communication protocol. The HSS interface can be exposed through GPIO pins or the External Memory port.

## HSS Features

- 8-bit, no parity code
- Programmable baud rate from 9600 baud to 2M baud
- Selectable 1- or 2-stop bit on transmit
- Programmable intercharacter gap timing for Block Transmit
- 8-byte receive FIFO
- Glitch filter on receive
- Block mode transfer directly to/from EZ-OTG internal memory (DMA transfer)
- Selectable CTS/RTS hardware signal handshake protocol
- Selectable XON/XOFF software handshake protocol
- Programmable Receive interrupt, Block Transfer Done interrupts
- Complete access to internal memory

HSS Pins

## Table 8. HSS Interface Pins

| Pin Name | Pin Number |
|----------|------------|
| CTS      | F6         |
| RTS      | E4         |
| RX       | E5         |
| TX       | E6         |

## Host Port Interface (HPI)

EZ-OTG has an HPI interface. The HPI interface provides DMA access to the EZ-OTG internal memory by an external host, plus a bidirectional mailbox register for supporting high-level communication protocols. This port is designed to be the primary high-speed connection to a host processor. Complete control of EZ-OTG can be accomplished through this interface via an extensible API and communication protocol. Other than the hardware communication protocols, a host processor has identical control over EZ-Host whether connecting to the HPI or HSS port. The HPI interface is exposed through GPIO pins.

**Note** It should be noted that for up to 3 ms after BIOS starts executing, GPIO[24:19] and GPIO[15:8] will be driven as outputs for a test mode. If these pins need to be used as inputs, a series resistor is required (10 ohm to 48 ohm is recommended). Refer to BIOS documentation for addition details. See section "Reset Pin" on page 10.

HPI Features

- 16-bit data bus interface
- 16 MB/s throughput
- Auto-increment of address pointer for fast block mode transfers
- Direct memory access (DMA) to internal memory
- Bidirectional Mailbox register
- Byte Swapping
- Complete access to internal memory
- Complete control of SIEs through HPI
- Dedicated HPI Status register

#### HPI Pins

### Table 9. HPI Interface Pins <sup>[1, 2]</sup>

| Pin Name | Pin Number |
|----------|------------|
| INT      | H4         |
| nRD      | G4         |
| nWR      | H5         |
| nCS      | G5         |
| A1       | H6         |

Notes

1. HPI\_INT is for the Outgoing Mailbox Interrupt.

2. HPI strobes are negative logic sampled on rising edge.

| Pin Name | Pin Number |
|----------|------------|
| A0       | F5         |
| D15      | F6         |
| D14      | E4         |
| D13      | E5         |
| D12      | E6         |
| D11      | D4         |
| D10      | D5         |
| D9       | C6         |
| D8       | C5         |
| D7       | B5         |
| D6       | B4         |
| D5       | C4         |
| D4       | B3         |
| D3       | A3         |
| D2       | C3         |
| D1       | A2         |
| D0       | B2         |

 Table 9. HPI Interface Pins <sup>[1, 2]</sup> (continued)

The two HPI address pins are used to address one of four possible HPI port registers as shown in Table 10 below.

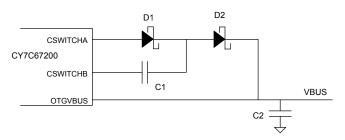

#### Table 10. HPI Addressing

| HPI A[1:0]  | A1 | A0 |
|-------------|----|----|
| HPI Data    | 0  | 0  |
| HPI Mailbox | 0  | 1  |
| HPI Address | 1  | 0  |
| HPI Status  | 1  | 1  |

## **Charge Pump Interface**

VBUS for the USB On-The-Go (OTG) port can be produced by EZ-OTG using its built-in charge pump and some external components. The circuit connections should look similar to Figure 1 below.

## Figure 1. Charge Pump

#### Component details:

- D1 and D2: Schottky diodes with a current rating greater than 60 mA.
- C1: Ceramic capacitor with a capacitance of 0.1 µF.
- C2: Capacitor value must be no more that 6.5 µF since that is the maximum capacitance allowed by the USB OTG specification for a dual-role device. The minimum value of C2 is 1 µF. There are no restrictions on the type of capacitor for C2.

If the VBUS charge pump circuit is not to be used, CSWITCHA, CSWITCHB, and OTGVBUS can be left unconnected.

#### Charge Pump Features

Meets OTG Supplement Requirements, see Table 41, "DC Characteristics: Charge Pump," on page 70.

#### Charge Pump Pins

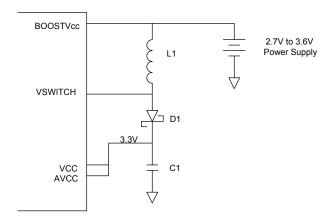

#### Table 11. Charge Pump Interface Pins

| Pin Name | Pin Number |
|----------|------------|
| OTGVBUS  | C1         |
| CSwitchA | D1         |
| CSwitchB | D2         |

## **Booster Interface**

EZ-OTG has an on-chip power booster circuit for use with power supplies that range between 2.7 V and 3.6 V. The booster circuit boosts the power to 3.3 V nominal to supply power for the entire chip. The booster circuit requires an external inductor, diode, and capacitor. During power down mode, the circuit is disabled to save power. Figure 2 shows how to connect the booster circuit.

## Figure 2. Power Supply Connection With Booster

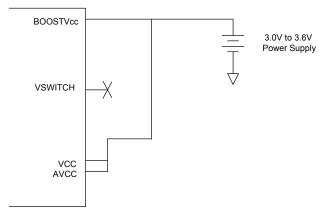

Component details:

- L1: Inductor with inductance of 10 µH and a current rating of at least 250 mA
- D1: Schottky diode with a current rating of at least 250 mA
- $\blacksquare$  C1: Tantalum or ceramic capacitor with a capacitance of at least 2.2  $\mu F$

Figure 3 shows how to connect the power supply when the booster circuit is not being used.

#### Figure 3. Power Supply Connection Without Booster

**Booster Pins** 

## Table 12. Charge Pump Interface Pins

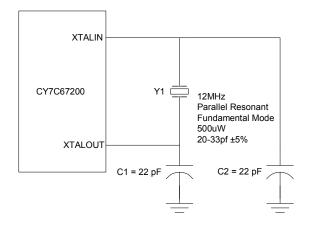

| Pin Name | Pin Number |
|----------|------------|
| BOOSTVcc | F1         |
| VSWITCH  | E2         |

## **Crystal Interface**

The recommended crystal circuit to be used with EZ-OTG is shown in Figure 4. If an oscillator is used instead of a crystal circuit, connect it to XTALIN and leave XTALOUT unconnected. For further information on the crystal requirements, see Table 39, "Crystal Requirements," on page 69.

## Figure 4. Crystal Interface

Crystal Pins

## Table 13. Crystal Pins

| Pin Name | Pin Number |
|----------|------------|
| XTALIN   | G3         |
| XTALOUT  | G2         |

## **Boot Configuration Interface**

EZ-OTG can boot into any one of four modes. The mode it boots into is determined by the TTL voltage level of GPIO[31:30] at the time nRESET is deasserted. Table 14 shows the different boot pin combinations possible. After a reset pin event occurs, the BIOS bootup procedure executes for up to 3 ms. GPIO[31:30] are sampled by the BIOS during bootup only. After bootup these pins are available to the application as GPIOs.

| GPIO31<br>(Pin 39) | GPIO30<br>(Pin 40) | Boot Mode                                     |  |
|--------------------|--------------------|---|--|
| 0                  | 0                  | Host Port Interface (HPI)                     |  |
| 0                  | 1                  | High Speed Serial (HSS)                       |  |
| 1                  | 0                  | Serial Peripheral Interface (SPI, slave mode) |  |
| 1                  | 1                  | I2C EEPROM (Standalone Mode)                  |  |

GPIO[31:30] must be pulled high or low, as needed, using resistors tied to  $V_{CC}$  or GND with resistor values between 5K ohm and 15K ohm. GPIO[31:30] must not be tied directly to  $V_{CC}$  or GND. Note that in Standalone mode, the pull ups on those two pins are used for the serial I2C EEPROM (if implemented). The resistors used for these pull ups must conform to the serial EEPROM manufacturer's requirements.

If any mode other then standalone is chosen, EZ-OTG will be in coprocessor mode. The device will power up with the appropriate communication interface enabled according to its boot pins and wait idle until a coprocessor communicates with it. See the BIOS documentation for greater detail on the boot process.

## **Operational Modes**

There are two modes of operation: Coprocessor and Standalone.

### Coprocessor Mode

EZ-OTG can act as a coprocessor to an external host processor. In this mode, an external host processor drives EZ-OTG and is the main processor rather then EZ-OTG's own 16-bit internal CPU. An external host processor may interface to EZ-OTG through one of the following three interfaces in coprocessor mode:

- HPI mode, a 16-bit parallel interface with up to 16 MBytes transfer rate
- HSS mode, a serial interface with up to 2M baud transfer rate
- SPI mode, a serial interface with up to 2 Mbits/s transfer rate.

At bootup GPIO[31:30] determine which of these three interfaces are used for coprocessor mode. Refer to Table 14 for details. Bootloading begins from the selected interface after POR + 3 ms of BIOS bootup.

## Standalone Mode

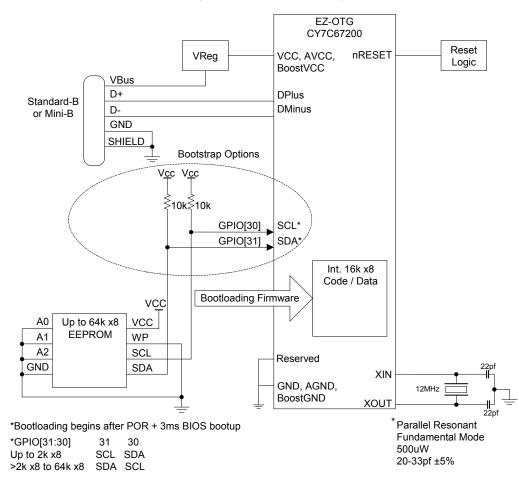

In standalone mode, there is no external processor connected to EZ-OTG. Instead, EZ-OTG's own internal 16-bit CPU is the main processor and firmware is typically downloaded from an EEPROM. Optionally, firmware may also be downloaded via USB. Refer to Table 14 for booting into standalone mode.

After booting into standalone mode (GPIO[31:30] = '11'), the following pins are affected:

- GPIO[31:30] are configured as output pins to examine the EEPROM contents.
- GPIO[28:27] are enabled for debug UART mode.
- GPIO[29] is configured as OTGID for OTG applications on PORT1A.
  - If OTGID is logic 1 then PORT1A (OTG) is configured as a USB peripheral.
  - □ If OTGID is logic 0 then PORT1A (OTG) is configured as a USB host.
- Ports 1B, 2A, and 2B default as USB peripheral ports.
- All other pins remain INPUT pins.

Minimum Hardware Requirements for Standalone Mode – Peripheral Only

## Figure 5. Minimum Standalone Hardware Configuration – Peripheral Only

## **Power Savings and Reset Description**

The EZ-OTG modes and reset conditions are described in this section.

## **Power Savings Mode Description**

EZ-OTG has one main power savings mode, Sleep. For detailed information on Sleep mode; See section "Sleep".

Sleep mode is used for USB applications to support USB suspend and non USB applications as the main chip power down mode.

In addition, EZ-OTG is capable of slowing down the CPU clock speed through the CPU Speed register [0xC008] without affecting other peripheral timing. Reducing the CPU clock speed from 48 MHz to 24 MHz reduces the overall current draw by around 8 mA while reducing it from 48 MHz to 3 MHz reduces the overall current draw by approximately 15 mA.

## Sleep

Sleep mode is the main chip power down mode and is also used for USB suspend. Sleep mode is entered by setting the Sleep Enable (bit 1) of the Power Control register [0xC00A]. During Sleep mode (USB Suspend) the following events and states are true:

- GPIO pins maintain their configuration during sleep (in suspend).
- External Memory Address pins are driven low.
- XTALOUT is turned off.
- Internal PLL is turned off.
- Firmware must disable the charge pump (OTG Control register [0xC098]) causing OTGVBUS to drop below 0.2 V. Otherwise OTGVBUS will only drop to V<sub>CC</sub> – (2 schottky diode drops).
- Booster circuit is turned off.
- USB transceivers is turned off.
- CPU suspends until a programmable wakeup event.

## External (Remote) Wakeup Source

There are several possible events available to wake EZ-OTG from Sleep mode as shown in Table 15. These may also be used as remote wakeup options for USB applications. See section "Power Control Register [0xC00A] [R/W]" on page 15.

Upon wakeup, code begins executing within 200 ms, the time it takes the PLL to stabilize.

## Table 15. wakeup Sources<sup>[3, 4]</sup>

| Wakeup Source (if enabled) | Event           |
|----------------------------|-----------------|
| USB Resume                 | D+/D– Signaling |
| OTGVBUS                    | Level           |
| OTGID                      | Any Edge        |
| HPI                        | Read            |
| HSS                        | Read            |
| SPI                        | Read            |
| IRQ0 (GPIO 24)             | Any Edge        |

## Power-On Reset (POR) Description

The length of the power-on-reset event can be defined by ( $V_{CC}$  ramp to valid) + (Crystal start up). A typical application might utilize a 12-ms power-on-reset event = ~7 ms + ~5 ms, respectively.

## **Reset Pin**

The Reset pin is active low and requires a minimum pulse duration of sixteen 12-MHz clock cycles (1.3 ms). A reset event restores all registers to their default POR settings. Code execution then begins 200 ms later at 0xFF00 with an immediate jump to 0xE000, the start of BIOS.

**Note** It should be noted that for up to 3 ms after BIOS starts executing, GPIO[24:19] and GPIO[15:8] will be driven as outputs for a test mode. If these pins need to be used as inputs, a series resistor is required (10 ohm to 48 ohm is recommended). Refer to BIOS documentation for addition details.

## **USB** Reset

A USB Reset affects registers 0xC090 and 0xC0B0, all other registers remain unchanged.

## **Memory Map**

Memory map information is presented in this section.

## Mapping

The EZ-OTG has just over 24 KB of addressable memory mapped from 0x0000 to 0xFFFF. This 24 KB contains both program and data space and is byte addressable. Figure 6. shows the various memory region address locations.

## **Internal Memory**

Of the internal memory, 15 KB is allocated for user's program and data code. The lower memory space from 0x0000 to 0x04A2 is reserved for interrupt vectors, general purpose registers, USB control registers, the stack, and other BIOS variables. The upper internal memory space contains EZ-OTG control registers from 0xC000 to 0xC0FF and the BIOS ROM itself from 0xE000 to 0xFFFF. For more information on the reserved lower memory or

Notes

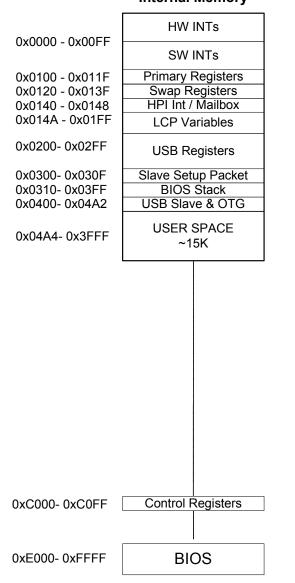

Read data will be discarded (dummy data).
 HPI\_INT will assert on a USB Resume.registers

the BIOS ROM, refer to the Programmers documentation and the BIOS documentation.

During development with the EZ-OTG toolset, the lower area of User's space (0x04A4 to 0x1000) should be left available to load the GDB stub. The GDB stub is required to allow the toolset debug access into EZ-OTG.

### Figure 6. Memory Map

## Internal Memory

## Registers

Some registers have different functions for a read vs. a write access or USB host vs. USB device mode. Therefore, registers of this type have multiple definitions for the same address.

The default register values listed in this data sheet may be altered to some other value during BIOS initialization. Refer to the BIOS documentation for Register initialization information.

## **Processor Control Registers**

There are eight registers dedicated to general processor control. Each of these registers is covered in this section and is summarized in Table 16.

#### **Table 16. Processor Control Registers**

| Register Name              | Address | R/W |
|----------------------------|---------|-----|
| CPU Flags Register         | 0xC000  | R   |
| Register Bank Register     | 0xC002  | R/W |
| Hardware Revision Register | 0xC004  | R   |
| CPU Speed Register         | 0xC008  | R/W |
| Power Control Register     | 0xC00A  | R/W |
| Interrupt Enable Register  | 0xC00E  | R/W |
| Breakpoint Register        | 0xC014  | R/W |
| USB Diagnostic Register    | 0xC03C  | W   |

## CPU Flags Register [0xC000] [R]

### Figure 7. CPU Flags Register

| Bit #      | 15 | 14       | 13 | 12                            | 11               | 10               | 9             | 8            |
|------------|----|----------|----|-------------------------------|------------------|------------------|---------------|--------------|
| Field      |    | Reserved |    |                               |                  |                  |               |              |
| Read/Write | _  | -        | -  | -                             | _                | _                | -             | _            |
| Default    | 0  | 0        | 0  | 0                             | 0                | 0                | 0             | 0            |
|            |    |          | •  | •                             |                  |                  |               |              |

| Read/Write | -  | -        | -  | R                             | R                | R                | R             | R            |
| Default    | 0  | 0        | 0  | Х                             | Х                | Х                | Х             | Х            |

### **Register Description**

The CPU Flags register is a read only register that gives processor flags status.

## Global Interrupt Enable (Bit 4)

The Global Interrupt Enable bit indicates if the Global Interrupts are enabled.

- 1: Enabled
- 0: Disabled

## Negative Flag (Bit 3)

The Negative Flag bit indicates if an arithmetic operation results in a negative answer.

- 1: MS result bit is '1'
- 0: MS result bit is not '1'

## Overflow Flag (Bit 2)

The Overflow Flag bit indicates if an overflow condition has occurred. An overflow condition can occur if an arithmetic result

was either larger than the destination operand size (for addition) or smaller than the destination operand should allow for subtraction.

- 1: Overflow occurred
- **0:** Overflow did not occur

## Carry Flag (Bit 1)

The Carry Flag bit indicates if an arithmetic operation resulted in a carry for addition, or borrow for subtraction.

- 1: Carry/Borrow occurred
- 0: Carry/Borrow did not occur

#### Zero Flag (Bit 0)

The Zero Flag bit indicates if an instruction execution resulted in a '0'.

- 1: Zero occurred
- 0: Zero did not occur

## Bank Register [0xC002] [R/W]

## Figure 8. Bank Register

| Bit #      | 15               | 14      | 13  | 12  | 11  | 10  | 9   | 8   |
|------------|------------------|---------|-----|-----|-----|-----|-----|-----|
| Field      |                  | Address |     |     |     |     |     |     |
| Read/Write | R/W              | R/W     | R/W | R/W | R/W | R/W | R/W | R/W |
| Default    | 0                | 0       | 0   | 0   | 0   | 0   | 0   | 1   |
|            |                  | -       | _   |     | -   | -   |     |     |
| Bit #      | 7                | 6       | 5   | 4   | 3   | 2   | 1   | 0   |
| Field      | Address Reserved |         |     |     |     |     |     |     |
| Read/Write | R/W              | R/W     | R/W | -   | -   | -   | -   | -   |
| Default    | 0                | 0       | 0   | Х   | Х   | Х   | Х   | Х   |

## **Register Description**

The Bank register maps registers R0–R15 into RAM. The eleven MSBs of this register are used as a base address for registers R0–R15. A register address is automatically generated by:

- 1. Shifting the four LSBs of the register address left by 1
- 2. ORing the four shifted bits of the register address with the 12 MSBs of the Bank Register
- 3. Forcing the LSB to zero

For example, if the Bank register is left at its default value of 0x0100, and R2 is read, then the physical address 0x0102 will be read. See Table 17 for details.

## Table 17. Bank Register Example

| Register        | Hex Value            | Binary Value        |
|-----------------|----------------------|---------------------|
| Bank            | 0x0100               | 0000 0001 0000 0000 |
| R14             | 0x000E << 1 = 0x001C | 0000 0000 0001 1100 |
| RAM<br>Location | 0x011C               | 0000 0001 0001 1100 |

#### Address (Bits [15:4])

The Address field is used as a base address for all register addresses to start from.

## Reserved

All reserved bits must be written as '0'.

## Hardware Revision Register [0xC004] [R]

## Figure 9. Revision Register

| Bit #      | 15 | 14       | 13 | 12  | 11    | 10 | 9 | 8 |
|------------|----|----------|----|-----|-------|----|---|---|
| Field      |    | Revision |    |     |       |    |   |   |
| Read/Write | R  | R        | R  | R   | R     | R  | R | R |
| Default    | Х  | Х        | Х  | Х   | Х     | Х  | Х | Х |
|            |    |          |    |     |       |    |   |   |

| Default    | Х  | Х        | Х  | Х   | Х     | Х  | Х | Х |

#### **Register Description**

The Hardware Revision register is a read-only register that indicates the silicon revision number. The first silicon revision is represented by 0x0101. This number is increased by one for each new silicon revision.

## Revision (Bits [15:0])

The Revision field contains the silicon revision number.

## CPU Speed Register [0xC008] [R/W]

## Figure 10. CPU Speed Register

| Bit #      | 15 | 14       | 13    | 12 | 11        | 10  | 9   | 8   |  |  |
|------------|----|----------|-------|----|-----------|-----|-----|-----|--|--|
| Field      |    | Reserved |       |    |           |     |     |     |  |  |
| Read/Write | -  | -        | -     | -  | -         | -   | -   | -   |  |  |
| Default    | 0  | 0        | 0     | 0  | 0         | 0   | 0   | 0   |  |  |
| Bit #      | 7  | 6        | 5     | 4  | 3         | 2   | 1   | 0   |  |  |
| Field      |    | Res      | erved |    | CPU Speed |     |     |     |  |  |
| Read/Write | -  | -        | -     | -  | R/W       | R/W | R/W | R/W |  |  |
| Default    | 0  | 0        | 0     | 0  | 1         | 1   | 1   | 1   |  |  |

## **Register Description**

The CPU Speed register allows the processor to operate at a user selected speed. This register only affects the CPU; all other peripheral timing is still based on the 48-MHz system clock (unless otherwise noted).

## CPU Speed (Bits[3:0])

The CPU Speed field is a divisor that selects the operating speed of the processor as defined in Table 18.

## Table 18. CPU Speed Definition

| CPU Speed [3:0] | Processor Speed |
|-----------------|-----------------|
| 0000            | 48 MHz/1        |
| 0001            | 48 MHz/2        |
| 0010            | 48 MHz/3        |
| 0011            | 48 MHz/4        |
| 0100            | 48 MHz/5        |
| 0101            | 48 MHz/6        |
| 0110            | 48 MHz/7        |
| 0111            | 48 MHz/8        |
| 1000            | 48 MHz/9        |
| 1001            | 48 MHz/10       |
| 1010            | 48 MHz/11       |
| 1011            | 48 MHz/12       |
| 1100            | 48 MHz/13       |
| 1101            | 48 MHz/14       |
| 1110            | 48 MHz/15       |
| 1111            | 48 MHz/16       |

## Reserved

All reserved bits must be written as '0'.

## Power Control Register [0xC00A] [R/W]

### Figure 11. Power Control Register

| Bit #      | 15                 | 14                           | 13       | 12                           | 11                 | 10             | 9                  | 8                  |

#### **Register Description**

The Power Control register controls the power-down and wakeup options. Either the sleep mode or the halt mode options can be selected. All other writable bits in this register can be used as a wakeup source while in sleep mode.

#### Host/Device 2 Wake Enable (Bit 14)

The Host/Device 2 Wake Enable bit enables or disables a wakeup condition to occur on an Host/Device 2 transition. This wake up from the SIE port does not cause an interrupt to the on-chip CPU.

1: Enable wakeup on Host/Device 2 transition.

0: Disable wakeup on Host/Device 2 transition.

#### Host/Device 1 Wake Enable (Bit 12)

The Host/Device 1 Wake Enable bit enables or disables a wakeup condition to occur on an Host/Device 1 transition. This wakeup from the SIE port does not cause an interrupt to the on-chip CPU.

1: Enable wakeup on Host/Device 1 transition

0: Disable wakeup on Host/Device 1 transition

#### OTG Wake Enable (Bit 11)

The OTG Wake Enable bit enables or disables a wakeup condition to occur on either an OTG VBUS\_Valid or OTG ID transition (IRQ20).

1: Enable wakeup on OTG VBUS valid or OTG ID transition

0: Disable wakeup on OTG VBUS valid or OTG ID transition

#### HSS Wake Enable (Bit 9)

The HSS Wake Enable bit enables or disables a wakeup condition to occur on an HSS Rx serial input transition. The processor may take several hundreds of microseconds before being operational after wakeup. Therefore, the incoming data byte that causes the wakeup will be discarded.

1: Enable wakeup on HSS Rx serial input transition

0: Disable wakeup on HSS Rx serial input transition

#### SPI Wake Enable (Bit 8)

The SPI Wake Enable bit enables or disables a wakeup condition to occur on a falling SPI\_nSS input transition. The processor may take several hundreds of microseconds before being operational after wakeup. Therefore, the incoming data byte that causes the wakeup will be discarded.

1: Enable wakeup on falling SPI nSS input transition

**0:** Disable SPI\_nSS interrupt

#### HPI Wake Enable (Bit 7)

The HPI Wake Enable bit enables or disables a wakeup condition to occur on an HPI interface read.

- 1: Enable wakeup on HPI interface read
- **0**: Disable wakeup on HPI interface read

#### GPI Wake Enable (Bit 4)

The GPI Wake Enable bit enables or disables a wakeup condition to occur on a GPIO(25:24) transition.

- 1: Enable wakeup on GPIO(25:24) transition
- 0: Disable wakeup on GPIO(25:24) transition

#### Boost 3V OK (Bit 2)

The Boost 3V OK bit is a read only bit that returns the status of the OTG Boost circuit.

1: Boost circuit not ok and internal voltage rails are below 3.0 V

0: Boost circuit ok and internal voltage rails are at or above 3.0 V

#### Sleep Enable (Bit 1)

Setting this bit to '1' immediately initiates SLEEP mode. While in SLEEP mode, the entire chip is paused achieving the lowest standby power state. All operations are paused, the internal clock is stopped, the booster circuit and OTG VBUS charge pump are all powered down, and the USB transceivers are powered down. All counters and timers are paused but will retain their values. SLEEP mode exits by any activity selected in this register. When SLEEP mode ends, instruction execution resumes within 0.5 ms.

1: Enable Sleep Mode

0: No Function

Halt Enable (Bit 0)

Setting this bit to '1' immediately initiates HALT mode. While in HALT mode, only the CPU is stopped. The internal clock still runs and all peripherals still operate, including the USB engines. The power savings using HALT in most cases will be minimal, but in applications that are very CPU intensive the incremental savings may provide some benefit.

The HALT state is exited when any enabled interrupt is triggered. Upon exiting the HALT state, one or two instructions immediately following the HALT instruction may be executed before the waking interrupt is serviced (you may want to follow the HALT instruction with two NOPs).

1: Enable Halt Mode

0: No Function

## Reserved

All reserved bits must be written as '0'.

## Interrupt Enable Register [0xC00E] [R/W]

## **Register Description**

The Interrupt Enable Register allows control of the hardware interrupt vectors.

## OTG Interrupt Enable (Bit 12)

The OTG Interrupt Enable bit enables or disables the OTG ID/OTG4.4 V Valid hardware interrupt.

1: Enable OTG interrupt

0: Disable OTG interrupt

## SPI Interrupt Enable (Bit 11)

The SPI Interrupt Enable bit enables or disables the following three SPI hardware interrupts: SPI TX, SPI RX, and SPI DMA Block Done.

1: Enable SPI interrupt

0: Disable SPI interrupt

#### Host/Device 2 Interrupt Enable (Bit 9)

The Host/Device 2 Interrupt Enable bit enables or disables all of the following Host/Device 2 hardware interrupts: Host 2 USB Done, Host 2 USB SOF/EOP, Host 2 WakeUp/Insert/Remove, Device 2 Reset, Device 2 SOF/EOP or WakeUp from USB, Device 2 Endpoint n.

1: Enable Host 2 and Device 2 interrupt

0: Disable Host 2 and Device 2 interrupt

## Host/Device 1 Interrupt Enable (Bit 8)

The Host/Device 1 Interrupt Enable bit enables or disables all of the following Host/Device 1 hardware interrupts: Host 1 USB Done, Host 1 USB SOF/EOP, Host 1 WakeUp/Insert/Remove, Device 1 Reset, Device 1 SOF/EOP or WakeUp from USB, Device 1 Endpoint n.

- 1: Enable Host 1 and Device 1 interrupt
- 0: Disable Host 1 and Device 1 interrupt

#### HSS Interrupt Enable (Bit 7)

The HSS Interrupt Enable bit enables or disables the following High-speed Serial Interface hardware interrupts: HSS Block Done, and HSS RX Full.

- 1: Enable HSS interrupt
- **0:** Disable HSS interrupt

#### In Mailbox Interrupt Enable (Bit 6)

The In Mailbox Interrupt Enable bit enables or disables the HPI: Incoming Mailbox hardware interrupt.

- 1: Enable MBXI interrupt
- **0:** Disable MBXI interrupt

#### Out Mailbox Interrupt Enable (Bit 5)

The Out Mailbox Interrupt Enable bit enables or disables the HPI: Outgoing Mailbox hardware interrupt.

- 1: Enable MBXO interrupt
- **0:** Disable MBXO interrupt

## UART Interrupt Enable (Bit 3)

The UART Interrupt Enable bit enables or disables the following UART hardware interrupts: UART TX and UART RX.

1: Enable UART interrupt

**0:** Disable UART interrupt

### GPIO Interrupt Enable (Bit 2)

The GPIO Interrupt Enable bit enables or disables the General Purpose IO Pins Interrupt (See the GPIO Control Register). When GPIO bit is reset, all pending GPIO interrupts are also cleared.

1: Enable GPIO interrupt

**0:** Disable GPIO interrupt

## Timer 1 Interrupt Enable (Bit 1)

The Timer 1 Interrupt Enable bit enables or disables the TImer1 Interrupt Enable. When this bit is reset, all pending Timer 1 interrupts are cleared.

1: Enable TM1 interrupt

0: Disable TM1 interrupt

## Timer 0 Interrupt Enable (Bit 0)

The Timer 0 Interrupt Enable bit enables or disables the TImer0 Interrupt Enable. When this bit is reset, all pending Timer 0 interrupts are cleared.

1: Enable TM0 interrupt

0: Disable TM0 interrupt

## Reserved

All reserved bits must be written as '0'.

## Breakpoint Register [0xC014] [R/W]

## Figure 13. Breakpoint Register

| Bit #      | 15  | 14      | 13  | 12  | 11    | 10  | 9   | 8   |  |
|------------|-----|---------|-----|-----|-------|-----|-----|-----|--|

| Read/Write | R/W | R/W     | R/W | R/W | R/W   | R/W | R/W | R/W |  |
| Default    | 0   | 0       | 0   | 0   | 0     | 0   | 0   | 0   |  |
|            |     |         |     |     |       |     |     |     |  |
| Bit #      | 7   | 6       | 5   | 4   | 3     | 2   | 1   | 0   |  |
| Field      |     |         |     | Ad  | dress |     |     |     |  |
| Read/Write | R/W | R/W     | R/W | R/W | R/W   | R/W | R/W | R/W |  |
| Default    | 0   | 0       | 0   | 0   | 0     | 0   | 0   | 0   |  |

## **Register Description**

The Breakpoint Register holds the breakpoint address. When the program counter match this address, the INT127 interrupt occurs. To clear this interrupt, a zero value must be written to this register.

## Address (Bits [15:0])

The Address field is a 16-bit field containing the breakpoint address.

## USB Diagnostic Register [0xC03C] [R/W]

## Figure 14. USB Diagnostic Register

| Bit #      | 15       | 14                              | 13                   | 12                              | 11       | 10       | 9            | 8   |  |

## **Register Description**

The USB Diagnostic Register provides control of diagnostic modes. It is intended for use by device characterization tests, not for normal operations. This register is Read/Write by the on-chip CPU but is write-only via the HPI port.

#### Port 2A Diagnostic Enable (Bit 15)

The Port 2A Diagnostic Enable bit enables or disables Port 2A for the test conditions selected in this register.

**1:** Apply any of the following enabled test conditions: J/K, DCK, SE0, RSF, RSL, PRD

0: Do not apply test conditions

## Port 1A Diagnostic Enable (Bit 15)

The Port 1A Diagnostic Enable bit enables or disables Port 1A for the test conditions selected in this register.

**1:** Apply any of the following enabled test conditions: J/K, DCK, SE0, RSF, RSL, PRD

0: Do not apply test conditions

## Pull-down Enable (Bit 6)

The Pull-down Enable bit enables or disables full-speed pull-down resistors (pull down on both D+ and D–) for testing.

1: Enable pull-down resistors on both D+ and D-

0: Disable pull-down resistors on both D+ and D-

## LS Pull-up Enable (Bit 5)

The LS Pull-up Enable bit enables or disables a low-speed pull-up resistor (pull up on D–) for testing.

1: Enable low-speed pull-up resistor on D-

0: Pull-up resistor is not connected on D-

### FS Pull-up Enable (Bit 4)

The FS Pull-up Enable bit enables or disables a full-speed pull-up resistor (pull up on D+) for testing.

1: Enable full-speed pull-up resistor on D+

0: Pull-up resistor is not connected on D+

#### Force Select (Bits [2:0])

The Force Select field bit selects several different test condition states on the data lines (D+/D-). See Table 19 for details.

### Table 19. Force Select Definition

| Force Select [2:0] | Data Line State |
|--------------------|-----------------|
| 1xx                | Assert SE0      |
| 01x                | Toggle JK       |
| 001                | Assert J        |
| 000                | Assert K        |

## Reserved

All reserved bits must be written as '0'.

#### **Timer Registers**

There are three registers dedicated to timer operations. Each of these registers are discussed in this section and are summarized in Table 20.

#### Table 20. Timer Registers

| Register Name           | Address | R/W |
|-------------------------|---------|-----|
| Watchdog Timer Register | 0xC00C  | R/W |
| Timer 0 Register        | 0xC010  | R/W |
| Timer 1 Register        | 0xC012  | R/W |

## Watchdog Timer Register [0xC00C] [R/W]

## Figure 15. Watchdog Timer Register

| Bit #      | 15  | 14       | 13              | 12  | 11  | 10  | 9             | 8               |  |
|------------|-----|----------|-----------------|-----|-----|-----|---------------|-----------------|--|
| Field      |     | Reserved |                 |     |     |     |               |                 |  |
| Read/Write | R/W | R/W      | R/W             | R/W | R/W | R/W | R/W           | R/W             |  |
| Default    | 0   | 0        | 0               | 0   | 0   | 0   | 0             | 0               |  |
|            |     | -        |                 | -   | -   | -   |               |                 |  |
| Bit #      | 7   | 6        | 5               | 4   | 3   | 2   | 1             | 0               |  |
| Field      | Res | erved    | Timeout<br>Flag |     |     |     | WDT<br>Enable | Reset<br>Strobe |  |
| Read/Write | R/W | R/W      | R/W             | R/W | R/W | R/W | R/W           | W               |  |
| Default    | 0   | 0        | 0               | 0   | 0   | 0   | 0             | 0               |  |

## **Register Description**

The Watchdog Timer register provides status and control over the Watchdog timer. The Watchdog timer can also interrupt the processor.

## Timeout Flag (Bit 5)

The Timeout Flag bit indicates if the Watchdog timer has expired. The processor can read this bit after exiting a reset to determine if a Watchdog timeout occurred. This bit is cleared on the next external hardware reset.

1: Watchdog timer expired

**0:** Watchdog timer did not expire

## Period Select (Bits [4:3])

The Period Select field is defined in Table 21. If this time expires before the Reset Strobe bit is set, the internal processor is reset.

## Table 21. Period Select Definition

| Period Select[4:3] | WDT Period Value |
|--------------------|------------------|
| 00                 | 1.4 ms           |
| 01                 | 5.5 ms           |
| 10                 | 22.0 ms          |
| 11                 | 66.0 ms          |

## Lock Enable (Bit 2)

The Lock Enable bit does not allow any writes to this register until a reset. In doing so the Watchdog timer can be set up and enabled permanently so that it can only be cleared on reset (the WDT Enable bit is ignored).

- 1: Watchdog timer permanently set
- 0: Watchdog timer not permanently set

#### WDT Enable (Bit 1)

The WDT Enable bit enables or disables the Watchdog timer.

- 1: Enable Watchdog timer operation
- 0: Disable Watchdog timer operation

#### Reset Strobe (Bit 0)

The Reset Strobe is a write-only bit that resets the Watchdog timer count. It must be set to '1' before the count expires to avoid a Watchdog trigger

1: Reset Count

## Reserved

All reserved bits must be written as '0'.

## Timer n Register [R/W]

■ Timer 0 Register 0xC010

■ Timer 1 Register 0xC012

## Figure 16. Timer n Register

| Bit #      | 15  | 14    | 13  | 12  | 11   | 10  | 9   | 8   |  |
|------------|-----|-------|-----|-----|------|-----|-----|-----|--|

| Bit #      | 7   | 6     | 5   | 4   | 3    | 2   | 1   | 0   |  |
| Field      |     |       |     | C   | ount |     |     |     |  |
| Read/Write | R/W | R/W   | R/W | R/W | R/W  | R/W | R/W | R/W |  |
| Default    | 1   | 1     | 1   | 1   | 1    | 1   | 1   | 1   |  |

## **Register Description**

The Timer n Register sets the Timer n count. Both Timer 0 and Timer 1 decrement by one every 1-µs clock tick. Each can provide an interrupt to the CPU when the timer reaches zero.

## Count (Bits [15:0])

The Count field sets the Timer count.

## **General USB Registers**

There is one set of registers dedicated to general USB control. This set consists of two identical registers, one for Host/Device Port 1 and one for Host/Device Port 2. This register set has functions for both USB host and USB peripheral options and is covered in this section and summarized in Table 22. USB Host-only registers are covered in Section "USB Host Only Registers" on page 22 and USB Device-only registers are covered in Section "USB Device Only Registers" on page 30.

## Table 22. USB Registers

| Register Name          | Address (SIE1/SIE2) | R/W |
|------------------------|---------------------|-----|
| USB n Control Register | 0xC08A/0xC0AA       | R/W |

USB n Control Register [R/W]

USB 1 Control Register 0xC08A

USB 2 Control Register 0xC0AA

## Figure 17. USB n Control Register

| Bit #      | 15                     |                            | 14 | 13                  | 12                  | 11               | 10                | 9              | 8                    |

| Default    | 0                      |                            | 0  | 0                   | 0                   | 0                | 0                 | 0              | 0                    |

## **Register Description**

The USB n Control register is used in both host and device mode. It monitors and controls the SIE and the data lines of the USB ports. This register can be accessed by the HPI interface.

## Port A D+ Status (Bit 13)

The Port A D+ Status bit is a read-only bit that indicates the value of DATA+ on Port A.

1: D+ is high

0: D+ is low

## Port A D– Status (Bit 12)

The Port A D– Status bit is a read-only bit that indicates the value of DATA– on Port A.

1: D– is high

**0:** D– is low

#### LOA (Bit 10)

The LOA bit selects the speed of Port A.

1: Port A is set to Low-speed mode

0: Port A is set to Full-speed mode

#### Mode Select (Bit 9)

The Mode Select bit sets the SIE for host or device operation. When set for device operation only one USB port is supported. The active port is selected by the Port Select bit in the Host n Count Register.

1: Host mode

0: Device mode

## Port A Resistors Enable (Bit 7)

The Port A Resistors Enable bit enables or disables the pull-up/pull-down resistors on Port A. When enabled, the Mode Select bit and LOA bit of this register sets the pull-up/pull-down resistors appropriately. When the Mode Select is set for Host mode, the pull-down resistors on the data lines (D+ and D–) are enabled. When the Mode Select is set for Device mode, a single pull-up resistor on either D+ or D–, determined by the LOA bit, will be enabled. See Table 23 for details.

1: Enable pull-up/pull-down resistors

**0**: Disable pull-up/pull-down resistors

## Table 23. USB Data Line Pull-up and Pull-down Resistors

| L0A | Mode<br>Select | Port n<br>Resistors<br>Enable | Function                                |
|-----|----------------|-------------------------------|---|
| Х   | Х              | 0                             | Pull up/Pull down on D+ and D– Disabled |
| Х   | 1              | 1                             | Pull down on D+ and D–<br>Enabled       |
| 1   | 0              | 1                             | Pull up on USB D– Enabled               |
| 0   | 0              | 1                             | Pull up on USB D+ Enabled               |

## Port A Force D± State (Bits [4:3])

The Port A Force D $\pm$  State field controls the forcing state of the D+D- data lines for Port A. This field forces the state of the Port A data lines independent of the Port Select bit setting. See Table 24 for details.

## Table 24. Port A Force D± State

| Port A Ford | ce D± State | Function                   |
|-------------|-------------|----------------------------|
| MSB         | LSB         | Function                   |
| 0           | 0           | Normal Operation           |
| 0           | 1           | Force USB Reset, SE0 State |
| 1           | 0           | Force J-State              |
| 1           | 1           | Force K-State              |

#### Suspend Enable (Bit 2)

The Suspend Enable bit enables or disables the suspend feature on both ports. When suspend is enabled the USB transceivers are powered down and can not transmit or received USB packets but can still monitor for a wakeup condition.

1: Enable suspend

0: Disable suspend

## Port A SOF/EOP Enable (Bit 0)

The Port A SOF/EOP Enable bit is only applicable in host mode. In Device mode this bit must be written as '0'. In host mode this bit enables or disables SOFs or EOPs for Port A. Either SOFs or EOPs will be generated depending on the LOA bit in the USB n Control Register when Port A is active.

1: Enable SOFs or EOPs

0: Disable SOFs or EOPs

## Reserved

All reserved bits must be written as '0'.

## **USB Host Only Registers**

There are twelve sets of dedicated registers to USB host only operation. Each set consists of two identical registers (unless otherwise noted); one for Host Port 1 and one for Host Port 2. These register sets are covered in this section and summarized in Table 25.

## Table 25. USB Host Only Register

| Register Name                    | Address<br>(Host 1/Host 2) | R/W |
|----------------------------------|----------------------------|-----|
| Host n Control Register          | 0xC080/0xC0A0              | R/W |
| Host n Address Register          | 0xC082/0xC0A2              | R/W |
| Host n Count Register            | 0xC084/0xC0A4              | R/W |
| Host n Endpoint Status Register  | 0xC086/0xC0A6              | R   |
| Host n PID Register              | 0xC086/0xC0A6              | W   |
| Host n Count Result Register     | 0xC088/0xC0A8              | R   |
| Host n Device Address Register   | 0xC088/0xC0A8              | W   |
| Host n Interrupt Enable Register | 0xC08C/0xC0AC              | R/W |
| Host n Status Register           | 0xC090/0xC0B0              | R/W |
| Host n SOF/EOP Count Register    | 0xC092/0xC0B2              | R/W |
| Host n SOF/EOP Counter Register  | 0xC094/0xC0B4              | R   |
| Host n Frame Register            | 0xC096/0xC0B6              | R   |

## Host n Control Register [R/W]

- Host 1 Control Register 0xC080
- Host 2 Control Register 0xC0A0

## Figure 18. Host n Control Register

| Bit #               | 15                 | 14                        | 13                    | 12            | 11 | 10       | 9 | 8             |  |
|---------------------|--------------------|---------------------------|-----------------------|---------------|----|----------|---|---------------|--|
| Field               |                    | Reserved                  |                       |               |    |          |   |               |  |
| Read/Write          | -                  | -                         | -                     | -             | -  | -        | - | -             |  |
| Default             | 0                  | 0                         | 0                     | 0             | 0  | 0        | 0 | 0             |  |
|                     |                    |                           |                       |               |    |          |   | -             |  |
| Bit #               | 7                  | 6                         | 5                     | 4             | 3  | 2        | 1 | 0             |  |
|                     |                    |                           |                       |               | •  | -        | • | U             |  |
| Field               | Preamble<br>Enable | Sequence<br>Select        | Sync<br>Enable        | ISO<br>Enable |    | Reserved |   | Arm<br>Enable |  |
| Field<br>Read/Write |                    | Sequence<br>Select<br>R/W | Sync<br>Enable<br>R/W |               | -  | Reserved | - | Arm           |  |

## **Register Description**

The Host n Control register allows high-level USB transaction control.

## Preamble Enable (Bit 7)

The Preamble Enable bit enables or disables the transmission of a preamble packet before all low-speed packets. This bit should only be set when communicating with a low-speed device.

- 1: Enable Preamble packet
- 0: Disable Preamble packet

#### Sequence Select (Bit 6)

The Sequence Select bit sets the data toggle for the next packet. This bit has no effect on receiving data packets; sequence checking must be handled in firmware.

- 1: Send DATA1
- 0: Send DATA0

#### Sync Enable (Bit 5)

The Sync Enable bit synchronizes the transfer with the SOF packet in full-speed mode and the EOP packet in low-speed mode.

Host n Address Register [R/W]

- Host 1 Address Register 0xC082
- Host 2 Address Register 0xC0A2

## Figure 19. Host n Address Register

**1:** The next enabled packet will be transferred after the SOF or EOP packet is transmitted

**0**: The next enabled packet will be transferred as soon as the SIE is free

#### ISO Enable (Bit 4)

The ISO Enable bit enables or disables an Isochronous transaction.

- 1: Enable Isochronous transaction
- 0: Disable Isochronous transaction

#### Arm Enable (Bit 0)

The Arm Enable bit arms an endpoint and starts a transaction. This bit is automatically cleared to '0' when a transaction is complete.

- 1: Arm endpoint and begin transaction
- 0: Endpoint disarmed

#### Reserved

All reserved bits must be written as '0'.

| Bit #               | 15      | 14      | 13  | 12        | 11           | 10  | 9   | 8   |

## **Register Description**

The Host n Address register is used as the base pointer into memory space for the current host transactions.

## Address (Bits [15:0])

The Address field sets the address pointer into internal RAM or ROM.

### Host n Count Register [R/W]

- Host 1 Count Register 0xC084
- Host 2 Count Register 0xC0A4

## Figure 20. Host n Count Register

| Default    | 0   | 0   | 0   | 0   | 0    | 0   | 0   | 0   |

#### **Register Description**

The Host n Count register is used to hold the number of bytes (packet length) for the current transaction. The maximum packet length is 1023 bytes in ISO mode. The Host Count value is used to determine how many bytes to transmit, or the maximum number of bytes to receive. If the number of received bytes is greater then the Host Count value then an overflow condition will be flagged by the Overflow bit in the Host n Endpoint Status register.

### Count (Bits [9:0])

The Count field sets the value for the current transaction data packet length. This value is retained when switching between host and device mode, and back again.

#### Reserved

All reserved bits must be written as '0'.

### Host n Endpoint Status Register [R]

- Host 1 Endpoint Status Register 0xC086
- Host 2 Endpoint Status Register 0xC0A6

## Figure 21. Host n Endpoint Status Register

| Bit #      | 15 | 14   | 13    | 12 | 11               | 10                | 9    | 8     |

## **Register Description**

The Host n Endpoint Status register is a read-only register that provides status for the last USB transaction.

## Overflow Flag (Bit 11)

The Overflow Flag bit indicates that the received data in the last data transaction exceeded the maximum length specified in the Host n Count Register. The Overflow Flag should be checked in response to a Length Exception signified by the Length Exception Flag set to '1'.

1: Overflow condition occurred

0: Overflow condition did not occur

#### Underflow Flag (Bit 10)

The Underflow Flag bit indicates that the received data in the last data transaction was less then the maximum length specified in the Host n Count register. The Underflow Flag should be checked in response to a Length Exception signified by the Length Exception Flag set to '1'.

- 1: Underflow condition occurred
- 0: Underflow condition did not occur

## Stall Flag (Bit 7)

The Stall Flag bit indicates that the peripheral device replied with a Stall in the last transaction.

1: Device returned Stall

**0**: Device did not return Stall

## NAK Flag (Bit 6)

The NAK Flag bit indicates that the peripheral device replied with a NAK in the last transaction.

1: Device returned NAK

0: Device did not return NAK

## Length Exception Flag (Bit 5)

The Length Exception Flag bit indicates the received data in the data stage of the last transaction does not equal the maximum Host Count specified in the Host n Count register. A Length Exception can either mean an overflow or underflow and the Overflow and Underflow flags (bits 11 and 10, respectively) should be checked to determine which event occurred.

1: An overflow or underflow condition occurred

0: An overflow or underflow condition did not occur

## Sequence Status (Bit 3)

The Sequence Status bit indicates the state of the last received data toggle from the device. Firmware is responsible for monitoring and handling the sequence status. The Sequence bit is only valid if the ACK bit is set to '1'. The Sequence bit is set to '0' when an error is detected in the transaction and the Error bit will be set.

1: DATA1

0: DATA0

Host n PID Register [W]

Host 1 PID Register 0xC086

Host 2 PID Register 0xC0A6

## Figure 22. Host n PID Register

## Timeout Flag (Bit 2)

The Timeout Flag bit indicates if a timeout condition occurred for the last transaction. A timeout condition can occur when a device either takes too long to respond to a USB host request or takes too long to respond with a handshake.

1: Timeout occurred

0: Timeout did not occur

## Error Flag (Bit 1)

The Error Flag bit indicates a transaction failed for any reason other than the following: Timeout, receiving a NAK, or receiving a STALL. Overflow and Underflow are not considered errors and do not affect this bit. CRC5 and CRC16 errors will result in an Error flag along with receiving incorrect packet types.

1: Error detected

0: No error detected

## ACK Flag (Bit 0)

The ACK Flag bit indicates two different conditions depending on the transfer type. For non-Isochronous transfers, this bit represents a transaction ending by receiving or sending an ACK packet. For Isochronous transfers, this bit represents a successful transaction that will not be represented by an ACK packet.

**1:** For non-Isochronous transfers, the transaction was ACKed. For Isochronous transfers, the transaction was completed successfully.

**0:** For non-Isochronous transfers, the transaction was not ACKed. For Isochronous transfers, the transaction was not completed successfully.

## **Register Description**

The Host n PID register is a write-only register that provides the PID and Endpoint information to the USB SIE to be used in the next transaction.

## PID Select (Bits [7:4])

The PID Select field defined as in Table 26. ACK and NAK tokens are automatically sent based on settings in the Host n Control register and do not need to be written in this register.

## Table 26. PID Select Definition

| PID TYPE | PID Select [7:4] |
|----------|------------------|
| set-up   | 1101 (D Hex)     |
| IN       | 1001 (9 Hex)     |
| OUT      | 0001 (1 Hex)     |
| SOF      | 0101 (5 Hex)     |

## Host n Count Result Register [R]

Host 1 Count Result Register 0xC088

■ Host 2 Count Result Register 0xC0A8

#### Figure 23. Host n Count Result Register

## Table 26. PID Select Definition (continued)

| PID TYPE | PID Select [7:4] |
|----------|------------------|
| PREAMBLE | 1100 (C Hex)     |
| NAK      | 1010 (A Hex)     |
| STALL    | 1110 (E Hex)     |
| DATA0    | 0011 (3 Hex)     |
| DATA1    | 1011 (B Hex)     |

#### Endpoint Select (Bits [3:0])

The Endpoint field allows addressing of up to 16 different endpoints.

## Reserved

All reserved bits must be written as '0'.

| Bit #      | 15 | 14     | 13 | 12 | 11    | 10 | 9 | 8 |  |  |  |

## **Register Description**

The Host n Count Result register is a read-only register that contains the size difference in bytes between the Host Count Value specified in the Host n Count register and the last packet received. If an overflow or underflow condition occurs, that is the received packet length differs from the value specified in the Host n Count register, the Length Exception Flag bit in the Host n Endpoint Status register will be set. The value in this register is only valid when the Length Exception Flag bit is set and the Error Flag bit is not set; both bits are in the Host n Endpoint Status register.

## Result (Bits [15:0])

The Result field contains the differences in bytes between the received packet and the value specified in the Host n Count register. If an overflow condition occurs, Result [15:10] is set to '111111', a 2's complement value indicating the additional byte count of the received packet. If an underflow condition occurs, Result [15:0] indicates the excess byte count (number of bytes not used).

## Reserved

All reserved bits must be written as '0'.

## Host n Device Address Register [W]

- Host 1 Device Address Register 0xC088
- Host 2 Device Address Register 0xC0A8

## **Register Description**

The Host n Device Address register is a write-only register that contains the USB Device Address that the host wishes to communicate with.

## Address (Bits [6:0])

The Address field contains the value of the USB address for the next device that the host is going to communicate with. This value must be written by firmware.

## Reserved

All reserved bits must be written as '0'.

## Host n Interrupt Enable Register [R/W]

- Host 1 Interrupt Enable Register 0xC08C
- Host 2 Interrupt Enable Register 0xC0AC

## **Register Description**

The Host n Interrupt Enable register allows control over host-related interrupts.

In this register a bit set to '1' enables the corresponding interrupt while '0' disables the interrupt.

## VBUS Interrupt Enable (Bit 15)

The VBUS Interrupt Enable bit enables or disables the OTG VBUS interrupt. When enabled this interrupt triggers on both the rising and falling edge of VBUS at the 4.4 V status (only supported in Port 1A). This bit is only available for Host 1 and is a reserved bit in Host 2.

1: Enable VBUS interrupt

## 0: Disable VBUS interrupt

#### ID Interrupt Enable (Bit 14)

The ID Interrupt Enable bit enables or disables the OTG ID interrupt. When enabled this interrupt triggers on both the rising and falling edge of the OTG ID pin (only supported in Port 1A). This bit is only available for Host 1 and is a reserved bit in Host 2.

- 1: Enable ID interrupt
- 0: Disable ID interrupt

#### SOF/EOP Interrupt Enable (Bit 9)

The SOF/EOP Interrupt Enable bit enables or disables the SOF/EOP timer interrupt.

1: Enable SOF/EOP timer interrupt

**0:** Disable SOF/EOP timer interrupt

### Port A Wake Interrupt Enable (Bit 6)

The Port A Wake Interrupt Enable bit enables or disables the remote wakeup interrupt for Port A.

- 1: Enable remote wakeup interrupt for Port A
- 0: Disable remote wakeup interrupt for Port A

#### Port A Connect Change Interrupt Enable (Bit 4)

The Port A Connect Change Interrupt Enable bit enables or disables the Connect Change interrupt on Port A. This interrupt triggers when either a device is inserted (SE0 state to J state) or a device is removed (J state to SE0 state).

Host n Status Register [R/W]

- Host 1 Status Register 0xC090
- Host 2 Status Register 0xC0B0

## Figure 26. Host n Status Register

1: Enable Connect Change interrupt

0: Disable Connect Change interrupt

### Done Interrupt Enable (Bit 0)

The Done Interrupt Enable bit enables or disables the USB Transfer Done interrupt. The USB Transfer Done triggers when either the host responds with an ACK, or a device responds with any of the following: ACK, NAK, STALL, or Timeout. This interrupt is used for both Port A and Port B.

1: Enable USB Transfer Done interrupt

0: Disable USB Transfer Done interrupt

#### Reserved

All reserved bits must be written as '0'.

| Bit #      | 15                     | 14                               | 13       | 12   | 11       | 10                      | 9                         | 8                      |

## **Register Description**

The Host n Status register provides status information for host operation. Pending interrupts can be cleared by writing a '1' to the corresponding bit. This register can be accessed by the HPI interface.

#### VBUS Interrupt Flag (Bit 15)

The VBUS Interrupt Flag bit indicates the status of the OTG VBUS interrupt (only for Port 1A). When enabled this interrupt triggers on both the rising and falling edge of VBUS at 4.4 V. This bit is only available for Host 1 and is a reserved bit in Host 2.

- 1: Interrupt triggered
- 0: Interrupt did not trigger

**ID Interrupt Flag** (Bit 14)

The ID Interrupt Flag bit indicates the status of the OTG ID interrupt (only for Port 1A). When enabled this interrupt triggers on both the rising and falling edge of the OTG ID pin. This bit is only available for Host 1 and is a reserved bit in Host 2.

#### 1: Interrupt triggered

0: Interrupt did not trigger

### SOF/EOP Interrupt Flag (Bit 9)

The SOF/EOP Interrupt Flag bit indicates the status of the SOF/EOP Timer interrupt. This bit triggers '1' when the SOF/EOP timer expires.

1: Interrupt triggered

0: Interrupt did not trigger

## Port A Wake Interrupt Flag (Bit 6)

The Port A Wake Interrupt Flag bit indicates remote wakeup on Port A.

1: Interrupt triggered

0: Interrupt did not trigger

## Port A Connect Change Interrupt Flag (Bit 4)

The Port A Connect Change Interrupt Flag bit indicates the status of the Connect Change interrupt on Port A. This bit triggers '1' on either a rising edge or falling edge of a USB Reset condition (device inserted or removed). Together with the Port A SE0 Status bit, it can be determined whether a device was inserted or removed.

1: Interrupt triggered

0: Interrupt did not trigger

## Host n SOF/EOP Count Register [R/W]

Host 1 SOF/EOP Count Register 0xC092

Host 2 SOF/EOP Count Register 0xC0B2

## Figure 27. Host n SOF/EOP Count Register

## Port A SE0 Status (Bit 2)

The Port A SE0 Status bit indicates if Port A is in an SE0 state or not. Together with the Port A Connect change Interrupt Flag bit, it can be determined whether a device was inserted (non-SE0 condition) or removed (SE0 condition).

1: SE0 condition

0: Non-SE0 condition

## Done Interrupt Flag (Bit 0)

The Done Interrupt Flag bit indicates the status of the USB Transfer Done interrupt. The USB Transfer Done triggers when either the host responds with an ACK, or a device responds with any of the following: ACK, NAK, STALL, or Timeout. This interrupt is used for both Port A and Port B.

1: Interrupt triggered

0: Interrupt did not trigger

## **Register Description**

The Host n SOF/EOP Count register contains the SOF/EOP Count Value that is loaded into the SOF/EOP counter. This value is loaded each time the SOF/EOP counter counts down to zero. The default value set in this register at power-up is 0x2EE0, which will generate a 1-ms time frame. The SOF/EOP counter is a down counter decremented at a 12-MHz rate. When this register is read, the value returned is the programmed SOF/EOP count value.

## Count (Bits [13:0])

The Count field sets the SOF/EOP counter duration.

## Reserved

All reserved bits must be written as '0'.

## Host n SOF/EOP Counter Register [R]

- Host 1 SOF/EOP Counter Register 0xC094

#### **Register Description**

The Host n SOF/EOP Counter register contains the current value of the SOF/EOP down counter. This value can be used to determine the time remaining in the current frame.

## Counter (Bits [13:0])

The Counter field contains the current value of the SOF/EOP down counter.

Host n Frame Register [R]

- Host 1 Frame Register 0xC096
- Host 2 Frame Register 0xC0B6

## Figure 29. Host n Frame Register

#### **Register Description**

The Host n Frame register maintains the next frame number to be transmitted (current frame number + 1). This value is updated after each SOF transmission. This register resets to 0x0000 after each CPU write to the Host n SOF/EOP Count register (Host 1: 0xC092, Host 2: 0xC0B2).

## Frame (Bits [10:0])

The Frame field contains the next frame number to be transmitted.

## Reserved

All reserved bits must be written as '0'.

## **USB Device Only Registers**

There are ten sets of USB Device Only registers. All sets consist of at least two registers, one for Device Port 1 and one for Device Port 2. In addition, each Device port has eight possible endpoints. This gives each endpoint register set eight registers for each Device Port for a total of 16 registers per set. The USB Device Only registers are covered in this section and summarized in Table 27.

## Table 27. USB Device Only Registers

| Register Name                        | Address<br>(Device 1/Device 2) | R/W |
|--------------------------------------|--------------------------------|-----|
| Device n Endpoint n Control Register | 0x02n0                         | R/W |
| Device n Endpoint n Address Register | 0x02n2                         | R/W |

## Table 27. USB Device Only Registers (continued)

| Register Name                             | Address<br>(Device 1/Device 2) | R/W |
|---|--------------------------------|-----|
| Device n Endpoint n Count Register        | 0x02n4                         | R/W |
| Device n Endpoint n Status Register       | 0x02n6                         | R/W |
| Device n Endpoint n Count Result Register | 0x02n8                         | R/W |
| Device n Interrupt Enable Register        | 0xC08C/0xC0AC                  | R/W |
| Device n Address Register                 | 0xC08E/0xC0AE                  | R/W |
| Device n Status Register                  | 0xC090/0xCB0                   | R/W |
| Device n Frame Number Register            | 0xC092/0xC0B2                  | R   |
| Device n SOF/EOP Count Register           | 0xC094/0xC0B4                  | W   |

#### Device n Endpoint n Control Register [R/W]

Device n Endpoint 0 Control Register [Device 1: 0x0200 Device 2: 0x0280]

Х

#### **Register Description**

Default

The Device n Endpoint n Control register provides control over a single EP in device mode. There are a total of eight endpoints for each of the two ports. All endpoints have the same definition for their Device n Endpoint n Control register.

Х

х

#### IN/OUT Ignore Enable (Bit 6)

х

The IN/OUT Ignore Enable bit forces endpoint 0 (EP0) to ignore all IN and OUT requests. This bit must be set so that EP0 only excepts Setup packets at the start of each transfer. This bit must be cleared to except IN/OUT transactions. This bit only applies to EP0.

1: Ignore IN/OUT requests

0: Do not ignore IN/OUT requests

#### Sequence Select (Bit 6)

Х

The Sequence Select bit determines whether a DATA0 or a DATA1 will be sent for the next data toggle. This bit has no effect on receiving data packets, sequence checking must be handled in firmware.

Х

Х

Х

1: Send a DATA1

0: Send a DATA0

## Stall Enable (Bit 5)

The Stall Enable bit sends a Stall in response to the next request (unless it is a setup request, which are always ACKed). This is a sticky bit and continues to respond with Stalls until cleared by firmware.

1: Send Stall

#### 0: Do not send Stall

#### ISO Enable (Bit 4)

The ISO Enable bit enables and disables an Isochronous transaction. This bit is only valid for EPs 1–7 and has no function for EP0.

- 1: Enable Isochronous transaction
- **0**: Disable Isochronous transaction

#### NAK Interrupt Enable (Bit 3)

The NAK Interrupt Enable bit enables and disables the generation of an Endpoint n interrupt when the device responds to the host with a NAK. The Endpoint n Interrupt Enable bit in the Device n Interrupt Enable register must also be set. When a NAK is sent to the host, the corresponding EP Interrupt Flag in the Device n Status register will be set. In addition, the NAK Flag in the Device n Endpoint n Status register will be set.

#### 1: Enable NAK interrupt

0: Disable NAK interrupt

## Direction Select (Bit 2)

The Direction Select bit needs to be set according to the expected direction of the next data stage in the next transaction. If the data stage direction is different from what is set in this bit, it will get NAKed and either the IN Exception Flag or the OUT Exception Flag will be set in the Device n Endpoint n Status register. If a setup packet is received and the Direction Select bit

is set incorrectly, the setup will be ACKed and the Set-up Status Flag will be set (refer to the setup bit of the Device n Endpoint n Status register for details).

1: OUT transfer (host to device)

**0:** IN transfer (device to host)

#### Enable (Bit 1)

The Enable bit must be set to allow transfers to the endpoint. If Enable is set to '0' then all USB traffic to this endpoint is ignored. If Enable is set '1' and Arm Enable (bit 0) is set '0' then NAKs will automatically be returned from this endpoint (except setup packets, which are always ACKed as long as the Enable bit is set).

**1:** Enable transfers to an endpoint

0: Do not allow transfers to an endpoint

#### Arm Enable (Bit 0)

The Arm Enable bit arms the endpoint to transfer or receive a packet. This bit is cleared to '0' when a transaction is complete.

1: Arm endpoint

0: Endpoint disarmed

#### Reserved

All reserved bits must be written as '0'.

Device n Endpoint n Address Register [R/W]

## **Register Description**

The Device n Endpoint n Address register is used as the base pointer into memory space for the current Endpoint transaction. There are a total of eight endpoints for each of the two ports. All endpoints have the same definition for their Device n Endpoint n Address register.

## Address (Bits [15:0])

The Address field sets the base address for the current transaction on a signal endpoint.

## Device n Endpoint n Count Register [R/W]

- Device n Endpoint 0 Count Register [Device 1: 0x0204 Device 2: 0x0284]
- Device n Endpoint 1 Count Register [Device 1: 0x0214 Device 2: 0x0294]

## **Register Description**

The Device n Endpoint n Count register designates the maximum packet size that can be received from the host for OUT transfers for a single endpoint. This register also designates the packet size to be sent to the host in response to the next IN token for a single endpoint. The maximum packet length is 1023 bytes in ISO mode. There are a total of eight endpoints for each of the two ports. All endpoints have the same definition for their Device n Endpoint n Count register.

## Count (Bits [9:0])

The Count field sets the current transaction packet length for a single endpoint.

## Reserved

All reserved bits must be written as '0'.

| Default    | Х             | Х           | Х                        | Х             | Х                | Х               | Х             | Х           |

## **Register Description**

The Device n Endpoint n Status register provides packet status information for the last transaction received or transmitted. This register is updated in hardware and does not need to be cleared by firmware. There are a total of eight endpoints for each of the two ports. All endpoints have the same definition for their Device n Endpoint n Status register.

The Device n Endpoint n Status register is a memory-based register that must be initialized to 0x0000 before USB Device operations are initiated. After initialization, this register must not be written to again.

## Overflow Flag (Bit 11)

The Overflow Flag bit indicates that the received data in the last data transaction exceeded the maximum length specified in the Device n Endpoint n Count register. The Overflow Flag should be checked in response to a Length Exception signified by the Length Exception Flag set to '1'.

1: Overflow condition occurred

0: Overflow condition did not occur

## Underflow Flag (Bit 10)

The Underflow Flag bit indicates that the received data in the last data transaction was less then the maximum length specified in the Device n Endpoint n Count register. The Underflow Flag should be checked in response to a Length Exception signified by the Length Exception Flag set to '1'.

- 1: Underflow condition occurred
- 0: Underflow condition did not occur

#### OUT Exception Flag (Bit 9)

The OUT Exception Flag bit indicates when the device received an OUT packet when armed for an IN.

- 1: Received OUT when armed for IN
- 0: Received IN when armed for IN

## IN Exception Flag (Bit 8)

The IN Exception Flag bit indicates when the device received an IN packet when armed for an OUT.

1: Received IN when armed for OUT

0: Received OUT when armed for OUT

## Stall Flag (Bit 7)

The Stall Flag bit indicates that a Stall packet was sent to the host.

1: Stall packet was sent to the host

0: Stall packet was not sent

## NAK Flag (Bit 6)

The NAK Flag bit indicates that a NAK packet was sent to the host.

1: NAK packet was sent to the host

0: NAK packet was not sent

## Length Exception Flag (Bit 5)

The Length Exception Flag bit indicates the received data in the data stage of the last transaction does not equal the maximum Endpoint Count specified in the Device n Endpoint n Count register. A Length Exception can either mean an overflow or underflow and the Overflow and Underflow flags (bits 11 and 10, respectively) should be checked to determine which event occurred.

1: An overflow or underflow condition occurred

0: An overflow or underflow condition did not occur

## Setup Flag (Bit 4)

The Setup Flag bit indicates that a setup packet was received. In device mode setup packets are stored at memory location 0x0300 for Device 1 and 0x0308 for Device 2. Setup packets are always accepted regardless of the Direction Select and Arm Enable bit settings as long as the Device n EP n Control register Enable bit is set.

1: Setup packet was received

0: Setup packet was not received

## Sequence Flag (Bit 3)

The Sequence Flag bit indicates whether the last data toggle received was a DATA1 or a DATA0. This bit has no effect on receiving data packets; sequence checking must be handled in firmware.

1: DATA1 was received

0: DATA0 was received

## Timeout Flag (Bit 2)

The Timeout Flag bit indicates whether a timeout condition occurred on the last transaction. On the device side, a timeout can occur if the device sends a data packet in response to an IN request but then does not receive a handshake packet in a predetermined time. It can also occur if the device does not receive the data stage of an OUT transfer in time.

1: Timeout occurred

0: Timeout condition did not occur

## Error Flag (Bit 2)

The Error Flag bit is set if a CRC5 and CRC16 error occurs, or if an incorrect packet type is received. Overflow and Underflow are not considered errors and do not affect this bit.

1: Error occurred

0: Error did not occur

## ACK Flag (Bit 0)

The ACK Flag bit indicates whether the last transaction was ACKed.

1: ACK occurred

0: ACK did not occur

## Device n Endpoint n Count Result Register [R/W]

- Device n Endpoint 0 Count Result Register [Device 1: 0x0208 Device 2: 0x0288]
- Device n Endpoint 1 Count Result Register [Device 1: 0x0218 Device 2: 0x0298]
- Device n Endpoint 2 Count Result Register [Device 1: 0x0228 Device 2: 0x02A8]
- Device n Endpoint 3 Count Result Register [Device 1: 0x0238 Device 2: 0x02B8]
- Device n Endpoint 4 Count Result Register [Device 1: 0x0248 Device 2: 0x02C8]
- Device n Endpoint 5 Count Result Register [Device 1: 0x0258 Device 2: 0x02D8]
- Device n Endpoint 6 Count Result Register [Device 1: 0x0268 Device 2: 0x02E8]
- Device n Endpoint 7 Count Result Register [Device 1: 0x0278 Device 2: 0x02F8]

#### **Register Description**

The Device n Endpoint n Count Result register contains the size difference in bytes between the Endpoint Count specified in the Device n Endpoint n Count register and the last packet received. If an overflow or underflow condition occurs, that is the received packet length differs from the value specified in the Device n Endpoint n Count register, the Length Exception Flag bit in the Device n Endpoint n Status register will be set. The value in this register is only considered when the Length Exception Flag bit is set and the Error Flag bit is not set; both bits are in the Device n Endpoint n Status register.

The Device n Endpoint n Count Result register is a memory based register that must be initialized to 0x0000 before USB Device operations are initiated. After initialization, this register must not be written to again.

## Result (Bits [15:0])

The Result field contains the differences in bytes between the received packet and the value specified in the Device n Endpoint n Count register. If an overflow condition occurs, Result [15:10] is set to '111111', a 2's complement value indicating the additional byte count of the received packet. If an underflow condition occurs, Result [15:0] indicates the excess byte count (number of bytes not used).

#### Reserved

All reserved bits must be written as '0'.

0

#### **Register Description**

Default

The Device n Interrupt Enable register provides control over device-related interrupts including eight different endpoint interrupts.

0

0

#### VBUS Interrupt Enable (Bit 15)

0

The VBUS Interrupt Enable bit enables or disables the OTG VBUS interrupt. When enabled this interrupt triggers on both the rising and falling edge of VBUS at the 4.4 V status (only supported in Port 1A). This bit is only available for Device 1 and is a reserved bit in Device 2.

- 1: Enable VBUS interrupt
- **0:** Disable VBUS interrupt

#### **ID Interrupt Enable** (Bit 14)

The ID Interrupt Enable bit enables or disables the OTG ID interrupt. When enabled this interrupt triggers on both the rising and falling edge of the OTG ID pin (only supported in Port 1A). This bit is only available for Device 1 and is a reserved bit in Device 2.

1: Enable ID interrupt

0: Disable ID interrupt

#### SOF/EOP Timeout Interrupt Enable (Bit 11)

The SOF/EOP Timeout Interrupt Enable bit enables or disables the SOF/EOP Timeout Interrupt. When enabled this interrupt triggers when the USB host fails to send a SOF or EOP packet within the time period specified in the Device n SOF/EOP Count register. In addition, the Device n Frame register counts the number of times the SOF/EOP Timeout Interrupt triggers between receiving SOF/EOPs.

1: SOF/EOP timeout occurred

0: SOF/EOP timeout did not occur

#### SOF/EOP Interrupt Enable (Bit 9)

0

The SOF/EOP Interrupt Enable bit enables or disables the SOF/EOP received interrupt.

0

1: Enable SOF/EOP Received interrupt

0

0: Disable SOF/EOP Received interrupt

#### Reset Interrupt Enable (Bit 8)

The Reset Interrupt Enable bit enables or disables the USB Reset Detected interrupt

- 1: Enable USB Reset Detected interrupt
- 0: Disable USB Reset Detected interrupt

#### EP7 Interrupt Enable (Bit 7)

The EP7 Interrupt Enable bit enables or disables an endpoint seven (EP7) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP7 Transaction Done interrupt

0: Disable EP7 Transaction Done interrupt

#### EP6 Interrupt Enable (Bit 6)

The EP6 Interrupt Enable bit enables or disables an endpoint six (EP6) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP6 Transaction Done interrupt

0: Disable EP6 Transaction Done interrupt

#### EP5 Interrupt Enable (Bit 5)

The EP5 Interrupt Enable bit enables or disables an endpoint five (EP5) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP5 Transaction Done interrupt

0: Disable EP5 Transaction Done interrupt

#### EP4 Interrupt Enable (Bit 4)

The EP4 Interrupt Enable bit enables or disables an endpoint four (EP4) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP4 Transaction Done interrupt

0: Disable EP4 Transaction Done interrupt

#### EP3 Interrupt Enable (Bit 3)

The EP3 Interrupt Enable bit enables or disables an endpoint three (EP3) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP3 Transaction Done interrupt

0: Disable EP3 Transaction Done interrupt

#### EP2 Interrupt Enable (Bit 2)

The EP2 Interrupt Enable bit enables or disables an endpoint two (EP2) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP2 Transaction Done interrupt

0: Disable EP2 Transaction Done interrupt

#### EP1 Interrupt Enable (Bit 1)

The EP1 Interrupt Enable bit enables or disables an endpoint one (EP1) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP1 Transaction Done interrupt

0: Disable EP1 Transaction Done interrupt

#### EP0 Interrupt Enable (Bit 0)

The EP0 Interrupt Enable bit enables or disables an endpoint zero (EP0) Transaction Done interrupt. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given Endpoint: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, the NAK Interrupt Enable bit in the Device n Endpoint Control register can also be set so that NAK responses triggers this interrupt.

1: Enable EP0 Transaction Done interrupt

0: Disable EP0 Transaction Done interrupt

# Reserved

All reserved bits must be written as '0'.

#### Device n Address Register [W]

- Device 1 Address Register 0xC08E
- Device 2 Address Register 0xC0AE

# Figure 36. Device n Address Register

#### **Register Description**

The Device n Address register holds the device address assigned by the host. This register initializes to the default address 0 at reset but must be updated by firmware when the host assigns a new address. Only USB data sent to the address contained in this register will be responded to, all others are ignored.

#### Address (Bits [6:0])

The Address field contains the USB address of the device assigned by the host.

#### Reserved

All reserved bits must be written as '0'.

#### Device n Status Register [R/W]

- Device 1 Status Register 0xC090
- Device 2 Status Register 0xC0B0

# Figure 37. Device n Status Register

#### **Register Description**

The Device n Status register provides status information for device operation. Pending interrupts can be cleared by writing a '1' to the corresponding bit. This register can be accessed by the HPI interface.

#### VBUS Interrupt Flag (Bit 15)

The VBUS Interrupt Flag bit indicates the status of the OTG VBUS interrupt (only for Port 1A). When enabled this interrupt triggers on both the rising and falling edge of VBUS at 4.4 V. This bit is only available for Device 1 and is a reserved bit in Device 2.

1: Interrupt triggered

**0:** Interrupt did not trigger

#### ID Interrupt Flag (Bit 14)

The ID Interrupt Flag bit indicates the status of the OTG ID interrupt (only for Port 1A). When enabled this interrupt triggers on both the rising and falling edge of the OTG ID pin. This bit is only available for Device 1 and is a reserved bit in Device 2.

1: Interrupt triggered

0: Interrupt did not trigger

#### SOF/EOP Interrupt Flag (Bit 9)

The SOF/EOP Interrupt Flag bit indicates if the SOF/EOP received interrupt has triggered.

1: Interrupt triggered

0: Interrupt did not trigger

# Reset Interrupt Flag (Bit 8)

The Reset Interrupt Flag bit indicates if the USB Reset Detected interrupt has triggered.

1: Interrupt triggered

0: Interrupt did not trigger

# EP7 Interrupt Flag (Bit 7)

The EP7 Interrupt Flag bit indicates if the endpoint seven (EP7) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### EP6 Interrupt Flag (Bit 6)

The EP6 Interrupt Flag bit indicates if the endpoint six (EP6) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### EP5 Interrupt Flag (Bit 5)

The EP5 Interrupt Flag bit indicates if the endpoint five (EP5) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### **EP4 Interrupt Flag** (Bit 4)

The EP4 Interrupt Flag bit indicates if the endpoint four (EP4) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### EP3 Interrupt Flag (Bit 3)

The EP3 Interrupt Flag bit indicates if the endpoint three (EP3) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### EP2 Interrupt Flag (Bit 2)

The EP2 Interrupt Flag bit indicates if the endpoint two (EP2) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### EP1 Interrupt Flag (Bit 1)

The EP1 Interrupt Flag bit indicates if the endpoint one (EP1) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### EP0 Interrupt Flag (Bit 0)

The EP0 Interrupt Flag bit indicates if the endpoint zero (EP0) Transaction Done interrupt has triggered. An EPx Transaction Done interrupt triggers when any of the following responses or events occur in a transaction for the device's given EP: send/receive ACK, send STALL, Timeout occurs, IN Exception Error, or OUT Exception Error. In addition, if the NAK Interrupt Enable bit in the Device n Endpoint Control register is set, this interrupt also triggers when the device NAKs host requests.

1: Interrupt triggered

0: Interrupt did not trigger

#### Reserved

All reserved bits must be written as '0'.

#### Device n Frame Number Register [R]

- Device 1 Frame Number Register 0xC092
- Device 2 Frame Number Register 0xC0B2

| Read/Write | R                       | R    | R                           | R     | R        | R  | R     | R |
| Default    | 0                       | 0    | 0                           | 0     | 0        | 0  | 0     | 0 |

#### **Register Description**

The Device n Frame Number register is a read only register that contains the Frame number of the last SOF packet received. This register also contains a count of SOF/EOP Timeout occurrences.

#### SOF/EOP Timeout Flag (Bit 15)

The SOF/EOP Timeout Flag bit indicates when an SOF/EOP Timeout Interrupt occurs.

1: An SOF/EOP Timeout interrupt occurred

0: An SOF/EOP Timeout interrupt did not occur

#### **SOF/EOP Timeout Interrupt Counter** (Bits [14:12])

Device n SOF/EOP Count Register [W]

- Device 1 SOF/EOP Count Register 0xC094
- Device 2 SOF/EOP Count Register 0xC0B4

#### Figure 39. Device n SOF/EOP Count Register

The SOF/EOP Timeout Interrupt Counter field increments by 1 from 0 to 7 for each SOF/EOP Timeout Interrupt. This field resets to 0 when a SOF/EOP is received. This field is only updated when the SOF/EOP Timeout Interrupt Enable bit in the Device n Interrupt Enable register is set.

#### Frame (Bits [10:0])

The Frame field contains the frame number from the last received SOF packet in full speed mode. This field has no function for low-speed mode. If a SOF Timeout occurs, this field contains the last received Frame number.

| Bit #      | 15       | 14 | 13 | 12    | 11 | 10 | 9 | 8 |  |
|------------|----------|----|----|-------|----|----|---|---|--|
| Field      | Reserved |    |    | Count |    |    |   |   |  |
| Read/Write | -        | -  | R  | R     | R  | R  | R | R |  |
| Default    | 0        | 0  | 1  | 0     | 1  | 1  | 1 | 0 |  |
|            |          | -  | -  |       |    |    |   |   |  |
| Bit #      | 7        | 6  | 5  | 4     | 3  | 2  | 1 | 0 |  |
| Field      | Count    |    |    |       |    |    |   |   |  |
| Read/Write | R        | R  | R  | R     | R  | R  | R | R |  |
| Default    | 1        | 1  | 1  | 0     | 0  | 0  | 0 | 0 |  |

The Device n SOF/EOP Count register must be written with the time expected between receiving a SOF/EOPs. If the SOF/EOP counter expires before an SOF/EOP is received, an SOF/EOP Timeout Interrupt can be generated. The SOF/EOP Timeout Interrupt Enable and SOF/EOP Timeout Interrupt Flag are located in the Device n Interrupt Enable and Status registers, respectively.

The SOF/EOP count must be set slightly greater than the expected SOF/EOP interval. The SOF/EOP counter decrements at a 12-MHz rate. Therefore in the case of an expected 1-ms SOF/EOP interval, the SOF/EOP count must be set slightly greater then 0x2EE0.

Count (Bits [13:0])

The Count field contains the current value of the SOF/EOP down counter. At power-up and reset, this value is set to 0x2EE0 and for expected 1-ms SOF/EOP intervals, this SOF/EOP count should be increased slightly.

#### Reserved

All reserved bits must be written as '0'.

## **OTG Control Registers**

There is one register dedicated for OTG operation. This register is covered in this section and summarized in Table 28.

# Table 28. OTG Registers

| Register Name        | Address | R/W |
|----------------------|---------|-----|
| OTG Control Register | C098H   | R/W |

#### OTG Control Register [0xC098] [R/W]

#### Figure 40. OTG Control Register

#### **Register Description**

The OTG Control register allows control and monitoring over the OTG port on Port1A.

#### VBUS Pull-up Enable (Bit 13)

The VBUS Pull-up Enable bit enables or disables a 500 ohm pull-up resistor onto OTG VBus.

- 1: 500 ohm pull-up resistor enabled
- 0: 500 ohm pull-up resistor disabled

#### Receive Disable (Bit 12)

The Receive Disable bit enables or powers down (disables) the OTG receiver section.

- 1: OTG receiver powered down and disabled
- 0: OTG receiver enabled

#### Charge Pump Enable (Bit 11)

The Charge Pump Enable bit enables or disables the OTG VBus charge pump.

1: OTG VBus charge pump enabled

#### 0: OTG VBus charge pump disabled

#### VBUS Discharge Enable (Bit 10)

The VBUS Discharge Enable bit enables or disables a 2K-ohm discharge pull-down resistor onto OTG VBus.

1: 2K-ohm pull-down resistor enabled

0: 2K-ohm pull-down resistor disabled

#### D+ Pull-up Enable (Bit 9)

The D+ Pull-up Enable bit enables or disables a pull-up resistor on the OTG D+ data line.

- **1:** OTG D+ dataline pull-up resistor enabled
- 0: OTG D+ dataline pull-up resistor disabled

#### D- Pull-up Enable (Bit 8)

The D– Pull-up Enable bit enables or disables a pull-up resistor on the OTG D– data line.

1: OTG D- dataline pull-up resistor enabled

0: OTG D- dataline pull-up resistor disabled

# D+ Pull-down Enable (Bit 7)

The D+ Pull-down Enable bit enables or disables a pull-down resistor on the OTG D+ data line.

- 1: OTG D+ dataline pull-down resistor enabled
- 0: OTG D+ dataline pull-down resistor disabled

# D- Pull-down Enable (Bit 6)

The D– Pull-down Enable bit enables or disables a pull-down resistor on the OTG D– data line.

1: OTG D- dataline pull-down resistor enabled

**0**: OTG D– dataline pull-down resistor disabled

# OTG Data Status (Bit 2)

The OTG Data Status bit is a read only bit and indicates the TTL logic state of the OTG VBus pin.

1: OTG VBus is greater than 2.4 V

0: OTG VBus is less than 0.8 V

#### ID Status (Bit 1)

The ID Status bit is a read only bit that indicates the state of the OTG ID pin on Port A.

1: OTG ID Pin is not connected directly to ground (>10K ohm)

0: OTG ID Pin is connected directly ground (< 10 ohm)

## VBUS Valid Flag (Bit 0)

The VBUS Valid Flag bit indicates whether OTG VBus is greater than 4.4 V. After turning on VBUS, firmware should wait at least 10  $\mu$ s before this reading this bit.

**1:** OTG VBus is greater then 4.4 V

0: OTG VBus is less then 4.4 V

#### Reserved

All reserved bits must be written as '0'.

# **GPIO Registers**

There are seven registers dedicated for GPIO operations. These seven registers are covered in this section and summarized in Table 29.

#### Table 29. GPIO Registers

| Register Name              | Address | R/W |
|----------------------------|---------|-----|
| GPIO Control Register      | 0xC006  | R/W |
| GPIO0 Output Data Register | 0xC01E  | R/W |
| GPIO0 Input Data Register  | 0xC020  | R   |
| GPIO0 Direction Register   | 0xC022  | R/W |
| GPIO1 Output Data Register | 0xC024  | R/W |
| GPIO1 Input Data Register  | 0xC026  | R   |
| GPIO1 Direction Register   | 0xC028  | R/W |

#### GPIO Control Register [0xC006] [R/W]

#### Figure 41. GPIO Control Register

| Bit #      | 15                      | 14       | 13            | 12    | 11            | 10  | 9                              | 8                     |
|------------|-------------------------|----------|---------------|-------|---------------|-----|--------------------------------|-----------------------|
| Field      | Write Protect<br>Enable | Reserved | Rese          | erved | SAS<br>Enable |     | Mode<br>Select                 |                       |
| Read/Write | R/W                     | -        | R             | -     | R/W           | R/W | R/W                            | R/W                   |
| Default    | 0                       | 0        | 0             | 0     | 0             | 0   | 0                              | 0                     |
|            |                         |          |               |       |               |     |                                |                       |
| Bit #      | 7                       | 6        | 5             | 4     | 3             | 2   | 1                              | 0                     |
| Field      | HSS<br>Enable           | Reserved | SPI<br>Enable |       | Reserved      |     | Interrupt 0<br>Polarity Select | Interrupt 0<br>Enable |
| Read/Write | R/W                     | -        | R/W           | -     | -             | -   | R/W                            | R/W                   |
| Default    | 0                       | 0        | 0             | 0     | 0             | 0   | 0                              | 0                     |

The GPIO Control register configures the GPIO pins for various interface options. It also controls the polarity of the GPIO interrupt on IRQ0 (GPIO24).

## Write Protect Enable (Bit 15)

The Write Protect Enable bit enables or disables the GPIO write protect. When Write Protect is enabled, the GPIO Mode Select [15:8] bits are read-only until a chip reset.

1: Enable Write Protect

0: Disable Write Protect

#### SAS Enable (Bit 11)

The SAS Enable bit, when in SPI mode, reroutes the SPI port SPI\_nSSI pin to GPIO[15] rather then GPIO[9].

1: Reroute SPI\_nss to GPIO[15]

0: Leave SPI\_nss on GPIO[9]

#### Mode Select (Bits [10:8])

The Mode Select field selects how GPIO[15:0] and GPIO[24:19] are used as defined in Table 30.

# Table 30. Mode Select Definition

| Mode Select<br>[10:8] | GPIO Configuration   |
|-----------------------|--|
| 111                   | Reserved   |
| 110                   | SCAN – (HW) Scan diagnostic. For produc-<br>tion test only. Not for normal operation |
| 101                   | HPI – Host Port Interface  |
| 100                   | Reserved   |
| 011                   | Reserved   |
| 010                   | Reserved   |

#### GPIO 0 Output Data Register [0xC01E] [R/W]

## Figure 42. GPIO 0 Output Data Register

# Table 30. Mode Select Definition (continued)

| 001 | Reserved                            |
|-----|-------------------------------------|
| 000 | GPIO – General Purpose Input Output |

#### HSS Enable (Bit 7)

The HSS Enable bit routes HSS to GPIO[15:12].

1: HSS is routed to GPIO

**0:** HSS is not routed to GPIOs. GPIO[15:12] are free for other purposes.

#### SPI Enable (Bit 5)

The SPI Enable bit routes SPI to GPIO[11:8]. If the SAS Enable bit is set, it overrides and routes the SPI\_nSSI pin to GPIO15.

1: SPI is routed to GPIO[11:8]

**0:** SPI is not routed to GPIO[11:8]. GPIO[11:8] are free for other purposes.

#### Interrupt 0 Polarity Select (Bit 1)

The Interrupt 0 Polarity Select bit selects the polarity for IRQ0.

1: Sets IRQ0 to rising edge

0: Sets IRQ0 to falling edge

# Interrupt 0 Enable (Bit 0)

The Interrupt 0 Enable bit enables or disables IRQ0. The GPIO bit on the interrupt Enable register must also be set in order for this for this interrupt to be enabled.

1: Enable IRQ0

0: Disable IRQ0

### Reserved

All reserved bits must be written as '0'.

| Bit #      | 15     | 14     | 13     | 12     | 11     | 10     | 9     | 8     |
|------------|--------|--------|--------|--------|--------|--------|-------|-------|
| Field      | GPIO15 | GPIO14 | GPIO13 | GPIO12 | GPIO11 | GPIO10 | GPIO9 | GPIO8 |
| Read/Write | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    | R/W   | R/W   |
| Default    | 0      | 0      | 0      | 0      | 0      | 0      | 0     | 0     |
|            |        |        |        |        |        |        |       |       |
| Bit #      | 7      | 6      | 5      | 4      | 3      | 2      | 1     | 0     |
| Field      | GPI07  | GPIO6  | GPIO5  | GPIO4  | GPIO3  | GPIO2  | GPIO1 | GPIO0 |
| Read/Write | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    | R/W   | R/W   |
| Default    | 0      | 0      | 0      | 0      | 0      | 0      | 0     | 0     |

The GPIO 0 Output Data register controls the output data of the GPIO pins. The GPIO 0 Output Data register controls GPIO15 to GPIO0 while the GPIO 1 Output Data register controls GPIO31 to GPIO19. When read, this register reads back the last data written, not the data on pins configured as inputs (see Input Data Register).

Writing a 1 to any bit will output a high voltage on the corresponding GPIO pin.

#### Reserved

All reserved bits must be written as '0'.

#### GPIO 1 Output Data Register [0xC024] [R/W]

# Figure 43. GPIO n Output Data Register

| Default    | 0      | 0      | 0      | 0      | 0      | 0     | 0        | 0      |

#### **Register Description**

The GPIO 1 Output Data register controls the output data of the GPIO pins. The GPIO 0 Output Data register controls GPIO15 to GPIO0 while the GPIO 1 Output Data register controls GPIO31 to GPIO19. When read, this register reads back the last data written, not the data on pins configured as inputs (see Input Data Register).

Writing a 1 to any bit will output a high voltage on the corresponding GPIO pin.

#### Reserved

All reserved bits must be written as '0'.

The GPIO 0 Direction register controls the direction of the GPIO data pins (input/output). The GPIO 0 Direction register controls GPIO15 to GPIO0 while the GPIO 1 Direction register controls GPIO31 to GPIO19.

When any bit of this register is set to '1', the corresponding GPIO data pin becomes an output. When any bit of this register is set to '0', the corresponding GPIO data pin becomes an input.

### Reserved

All reserved bits must be written as '0'.

#### **Register Description**

The GPIO 1 Direction register controls the direction of the GPIO data pins (input/output). The GPIO 0 Direction register controls GPIO15 to GPIO0 while the GPIO 1 Direction register controls GPIO31 to GPIO19.

When any bit of this register is set to '1', the corresponding GPIO data pin becomes an output. When any bit of this register is set to '0', the corresponding GPIO data pin becomes an input.

# Reserved

All reserved bits must be written as '0'.

#### **HSS Registers**

There are eight registers dedicated to HSS operation. Each of these registers are covered in this section and summarized in Table 31.

#### Table 31. HSS Registers

| Register Name                 | Address | R/W |
|-------------------------------|---------|-----|
| HSS Control Register          | 0xC070  | R/W |
| HSS Baud Rate Register        | 0xC072  | R/W |
| HSS Transmit Gap Register     | 0xC074  | R/W |
| HSS Data Register             | 0xC076  | R/W |
| HSS Receive Address Register  | 0xC078  | R/W |
| HSS Receive Length Register   | 0xC07A  | R/W |
| HSS Transmit Address Register | 0xC07C  | R/W |
| HSS Transmit Length Register  | 0xC07E  | R/W |

#### **Register Description**

The HSS Control register provides high-level status and control over the HSS port.

#### HSS Enable (Bit 15)

The HSS Enable bit enables or disables HSS operation.

1: Enables HSS operation

**0:** Disables HSS operation

#### RTS Polarity Select (Bit 14)

The RTS Polarity Select bit selects the polarity of RTS.

- 1: RTS is true when LOW
- 0: RTS is true when HIGH

#### CTS Polarity Select (Bit 13)

The CTS Polarity Select bit selects the polarity of CTS.

1: CTS is true when LOW

0: CTS is true when HIGH

#### XOFF (Bit 12)

The XOFF bit is a read-only bit that indicates if an XOFF has been received. This bit is automatically cleared when an XON is received.

1: XOFF received

0: XON received

#### XOFF Enable (Bit 11)

The XOFF Enable bit enables or disables XON/XOFF software handshaking.

1: Enable XON/XOFF software handshaking

0: Disable XON/XOFF software handshaking

#### CTS Enable (Bit 10)

The CTS Enable bit enables or disables CTS/RTS hardware handshaking.

1: Enable CTS/RTS hardware handshaking

0: Disable CTS/RTS hardware handshaking

#### Receive Interrupt Enable (Bit 9)

The Receive Interrupt Enable bit enables or disables the Receive Ready and Receive Packet Ready interrupts.

1: Enable the Receive Ready and Receive Packet Ready interrupts

0: Disable the Receive Ready and Receive Packet Ready interrupts

#### Done Interrupt Enable (Bit 8)

The Done Interrupt Enable bit enables or disables the Transmit Done and Receive Done interrupts.

1: Enable the Transmit Done and Receive Done interrupts

0: Disable the Transmit Done and Receive Done interrupts

#### Transmit Done Interrupt Flag (Bit 7)

The Transmit Done Interrupt Flag bit indicates the status of the Transmit Done Interrupt. It will set when a block transmit is finished. To clear the interrupt, a '1' must be written to this bit.

- 1: Interrupt triggered
- 0: Interrupt did not trigger

#### Receive Done Interrupt Flag (Bit 6)

The Receive Done Interrupt Flag bit indicates the status of the Receive Done Interrupt. It will set when a block transmit is finished. To clear the interrupt, a '1' must be written to this bit.

- 1: Interrupt triggered
- 0: Interrupt did not trigger

#### One Stop Bit (Bit 5)

The One Stop Bit bit selects between one and two stop bits for transmit byte mode. In receive mode, the number of stop bits may vary and does not need to be fixed.

1: One stop bit

0: Two stop bits

# Transmit Ready (Bit 4)

The Transmit Ready bit is a read only bit that indicates if the HSS Transmit FIFO is ready for the CPU to load new data for transmission.

1: HSS transmit FIFO ready for loading

**0:** HSS transmit FIFO not ready for loading

#### Packet Mode Select (Bit 3)

The Packet Mode Select bit selects between Receive Packet Ready and Receive Ready as the interrupt source for the RxIntr interrupt.

1: Selects Receive Packet Ready as the source

0: Selects Receive Ready as the source

## Receive Overflow Flag (Bit 2)

The Receive Overflow Flag bit indicates if the Receive FIFO overflowed when set. This flag can be cleared by writing a '1' to this bit.

1: Overflow occurred

0: Overflow did not occur

#### HSS Baud Rate Register [0xC072] [R/W]

#### Figure 49. HSS Baud Rate Register

## Receive Packet Ready Flag (Bit 1)

The Receive Packet Ready Flag bit is a read only bit that indicates if the HSS receive FIFO is full with eight bytes.

1: HSS receive FIFO is full

0: HSS receive FIFO is not full

#### Receive Ready Flag (Bit 0)

The Receive Ready Flag is a read only bit that indicates if the HSS receive FIFO is empty.

1: HSS receive FIFO is not empty (one or more bytes is reading for reading)

**0:** HSS receive FIFO is empty

| Bit #      | 15  | 14       | 13  | 12  | 11   | 10   | 9   | 8   |
|------------|-----|----------|-----|-----|------|------|-----|-----|
| Field      |     | Reserved |     |     |      | Baud |     |     |
| Read/Write | -   | -        | -   | R/W | R/W  | R/W  | R/W | R/W |
| Default    | 0   | 0        | 0   | 0   | 0    | 0    | 0   | 0   |
|            |     |          |     |     |      |      |     |     |
| Bit #      | 7   | 6        | 5   | 4   | 3    | 2    | 1   | 0   |
| Field      |     |          |     | E   | Baud |      |     |     |
| Read/Write | R/W | R/W      | R/W | R/W | R/W  | R/W  | R/W | R/W |
| Default    | 0   | 0        | 0   | 1   | 0    | 1    | 1   | 1   |

The HSS Baud Rate register sets the HSS Baud Rate. At reset, the default value is 0x0017 which sets the baud rate to 2.0 MHz.

# Baud (Bits [12:0])

The Baud field is the baud rate divisor minus one, in units of 1/48 MHz. Therefore the Baud Rate = 48 MHz/(Baud + 1). This puts a constraint on the Baud Value as follows:  $(24 - 1) \le Baud \ge (5000 - 1)$ 

#### Reserved

All reserved bits must bit written as '0'.

HSS Transmit Gap Register [0xC074] [R/W]

# Figure 50. HSS Transmit Gap Register

# **Register Description**

The HSS Transmit Gap register is only valid in block transmit mode. It allows for a programmable number of stop bits to be inserted thus overwriting the One Stop Bit in the HSS Control register. The default reset value of this register is 0x0009, equivalent to two stop bits.

#### Transmit Gap Select (Bits [7:0])

The Transmit Gap Select field sets the inactive time between transmitted bytes. The inactive time =  $(Transmit Gap Select - 7)^*$  bit time. Therefore an Transmit Gap Select Value of 8 is equal to having one Stop bit.

#### Reserved

All reserved bits must be written as '0'.

HSS Data Register [0xC076] [R/W]

#### Figure 51. HSS Data Register

| Bit #      | 15  | 14  | 13  | 12   | 11    | 10  | 9   | 8   |
|------------|-----|-----|-----|------|-------|-----|-----|-----|
| Field      |     |     |     | Rese | erved |     |     |     |
| Read/Write | -   | -   | -   | -    | -     | -   | -   | -   |
| Default    | Х   | Х   | Х   | Х    | Х     | Х   | Х   | Х   |
| Bit #      | 7   | 6   | 5   | 4    | 3     | 2   | 1   | 0   |
| Field      |     |     |     | Da   | ita   |     |     |     |
| Read/Write | R/W | R/W | R/W | R/W  | R/W   | R/W | R/W | R/W |
| Default    | Х   | Х   | Х   | Х    | Х     | Х   | Х   | Х   |

The HSS Data register contains data received on the HSS port (not for block receive mode) when read. This receive data is valid when the Receive Ready bit of the HSS Control register is set to '1'. Writing to this register initiates a single byte transfer of data. The Transmit Ready Flag in the HSS Control register must read '1' before writing to this register (this avoids disrupting the previous/current transmission).

# Data (Bits [7:0])

The Data field contains the data received or to be transmitted on the HSS port.

### Reserved

All reserved bits must be written as '0'.

# HSS Receive Address Register [0xC078] [R/W]

#### Figure 52. HSS Receive Address Register

| Bit #      | 15  | 14      | 13  | 12  | 11    | 10  | 9   | 8   |  |  |  |
|------------|-----|---------|-----|-----|-------|-----|-----|-----|--|--|--|
| Field      |     | Address |     |     |       |     |     |     |  |  |  |
| Read/Write | R/W | R/W     | R/W | R/W | R/W   | R/W | R/W | R/W |  |  |  |
| Default    | 0   | 0       | 0   | 0   | 0     | 0   | 0   | 0   |  |  |  |
| Bit #      | 7   | 6       | 5   | 4   | 3     | 2   | 1   | 0   |  |  |  |
| Field      |     |         |     | Ad  | dress |     |     | 1   |  |  |  |
| Read/Write | R/W | R/W     | R/W | R/W | R/W   | R/W | R/W | R/W |  |  |  |
| Default    | 0   | 0       | 0   | 0   | 0     | 0   | 0   | 0   |  |  |  |

# **Register Description**

The HSS Receive Address register is used as the base pointer address for the next HSS block receive transfer.

#### Address (Bits [15:0])

The Address field sets the base pointer address for the next HSS block receive transfer.

HSS Receive Counter Register [0xC07A] [R/W]

# Figure 53. HSS Receive Counter Register

| Bit #      | 15  | 14      | 13      | 12  | 11    | 10  | 9   | 8   |  |
|------------|-----|---------|---------|-----|-------|-----|-----|-----|--|
| Field      |     |         | Counter |     |       |     |     |     |  |
| Read/Write | -   | R/W R/V |         |     |       |     |     |     |  |
| Default    | 0   | 0       | 0       | 0   | 0     | 0   | 0   | 0   |  |
| Bit #      | 7   | 6       | 5       | 4   | 3     | 2   | 1   | 0   |  |
| Field      |     |         |         | Co  | unter |     |     |     |  |
| Read/Write | R/W | R/W     | R/W     | R/W | R/W   | R/W | R/W | R/W |  |
| Default    | 0   | 0       | 0       | 0   | 0     | 0   | 0   | 0   |  |

The HSS Receive Counter register designates the block byte length for the next HSS receive transfer. This register must be loaded with the word count minus one to start the block receive transfer. As each byte is received this register value is decremented. When read, this register indicates the remaining length of the transfer.

# Counter (Bits [9:0])

The Counter field value is equal to the word count minus one giving a maximum value of 0x03FF (1023) or 2048 bytes. When the transfer is complete this register returns 0x03FF until reloaded.

#### Reserved

All reserved bits must be written as '0'.

HSS Transmit Address Register [0xC07C] [R/W]

#### Figure 54. HSS Transmit Address Register

# **Register Description**

The HSS Transmit Address register is used as the base pointer address for the next HSS block transmit transfer.

#### Address (Bits [15:0])

The Address field sets the base pointer address for the next HSS block transmit transfer.

HSS Transmit Counter Register [0xC07E] [R/W]

# Figure 55. HSS Transmit Counter Register

| Bit #      | 15  | 14  | 13   | 12    | 11    | 10  | 9       | 8   |
|------------|-----|-----|------|-------|-------|-----|---------|-----|
| Field      |     |     | Rese | erved |       |     | Counter |     |
| Read/Write | -   | -   | -    | -     | -     | -   | R/W     | R/W |
| Default    | 0   | 0   | 0    | 0     | 0     | 0   | 0       | 0   |
|            |     |     |      |       |       |     |         |     |
| Bit #      | 7   | 6   | 5    | 4     | 3     | 2   | 1       | 0   |
| Field      |     |     |      | Co    | unter |     |         |     |
| Read/Write | R/W | R/W | R/W  | R/W   | R/W   | R/W | R/W     | R/W |
| Default    | 0   | 0   | 0    | 0     | 0     | 0   | 0       | 0   |

The HSS Transmit Counter register designates the block byte length for the next HSS transmit transfer. This register must be loaded with the word count minus one to start the block transmit transfer. As each byte is transmitted this register value is decremented. When read, this register indicates the remaining length of the transfer.

#### Counter (Bits [9:0])

The Counter field value is equal to the word count minus one giving a maximum value of 0x03FF (1023) or 2048 bytes. When the transfer is complete this register returns 0x03FF until reloaded.

#### Reserved

All reserved bits must be written as '0'.

HPI Breakpoint Register [0x0140] [R]

#### Figure 56. HPI Breakpoint Register

# **HPI Registers**

There are five registers dedicated to HPI operation. In addition, there is an HPI status port which can be address over HPI. Each of these registers is covered in this section and are summarized in Table 32.

#### Table 32. HPI Registers

| Register Name              | Address | R/W |
|----------------------------|---------|-----|
| HPI Breakpoint Register    | 0x0140  | R   |
| Interrupt Routing Register | 0x0142  | R   |
| SIE1msg Register           | 0x0144  | W   |
| SIE2msg Register           | 0x0148  | W   |
| HPI Mailbox Register       | 0xC0C6  | R/W |

| Bit #      | 15      | 14 | 13 | 12 | 11    | 10 | 9 | 8 |  |  |
|------------|---------|----|----|----|-------|----|---|---|--|--|
| Field      | Address |    |    |    |       |    |   |   |  |  |
| Read/Write | R       | R  | R  | R  | R     | R  | R | R |  |  |
| Default    | 0       | 0  | 0  | 0  | 0     | 0  | 0 | 0 |  |  |
|            |         | -  |    |    | -     | -  | - | - |  |  |
| Bit #      | 7       | 6  | 5  | 4  | 3     | 2  | 1 | 0 |  |  |
| Field      |         |    |    | Ad | dress |    |   |   |  |  |
| Read/Write | R       | R  | R  | R  | R     | R  | R | R |  |  |
| Default    | 0       | 0  | 0  | 0  | 0     | 0  | 0 | 0 |  |  |

#### **Register Description**

The HPI Breakpoint register is a special on-chip memory location, which the external processor can access using normal HPI memory read/write cycles. This register is read-only by the CPU but is read/write by the HPI port. The contents of this register have the same effect as the Breakpoint register [0xC014]. This special Breakpoint register is used by software debuggers which interface through the HPI port instead of the serial port.

When the program counter matches the Breakpoint Address, the INT127 interrupt triggers. To clear this interrupt, a zero value must be written to this register.

#### Address (Bits [15:0])

The Address field is a 16-bit field containing the breakpoint address.

Interrupt Routing Register [0x0142] [R]

# Figure 57. Interrupt Routing Register

| Bit #      | 15                    | 14                  | 13                        | 12                        | 11                        | 10                        | 9                       | 8                    |
|------------|-----------------------|---------------------|---------------------------|---------------------------|---------------------------|---------------------------|-------------------------|----------------------|
| Field      | VBUS to HPI<br>Enable | ID to HPI<br>Enable | SOF/EOP2 to<br>HPI Enable | SOF/EOP2 to<br>CPU Enable | SOF/EOP1 to<br>HPI Enable | SOF/EOP1 to<br>CPU Enable | Reset2 to HPI<br>Enable | HPI Swap 1<br>Enable |

| Read/Write | -                        | -                        | -        | - | -                      | -                      | -                       | -                    |
| Default    | 0                        | 0                        | 0        | 0 | 0                      | 0                      | 0                       | 0                    |

The Interrupt Routing register allows the HPI port to take over some or all of the SIE interrupts that usually go to the on-chip CPU. This register is read-only by the CPU but is read/write by the HPI port. By setting the appropriate bit to '1', the SIE interrupt is routed to the HPI port to become the HPI\_INTR signal and also readable in the HPI Status register. The bits in this register select where the interrupts are routed. The individual interrupt enable is handled in the SIE interrupt enable register.

#### VBUS to HPI Enable (Bit 15)

The VBUS to HPI Enable bit routes the OTG VBUS interrupt to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### ID to HPI Enable (Bit 14)

The ID to HPI Enable bit routes the OTG ID interrupt to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### SOF/EOP2 to HPI Enable (Bit 13)

The SOF/EOP2 to HPI Enable bit routes the SOF/EOP2 interrupt to the HPI port.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### SOF/EOP2 to CPU Enable (Bit 12)

The SOF/EOP2 to CPU Enable bit routes the SOF/EOP2 interrupt to the on-chip CPU. Since the SOF/EOP2 interrupt can be routed to both the on-chip CPU and the HPI port the firmware must ensure only one of the two (CPU, HPI) resets the interrupt.

1: Route signal to CPU

0: Do not route signal to CPU

#### SOF/EOP1 to HPI Enable (Bit 11)

The SOF/EOP1 to HPI Enable bit routes the SOF/EOP1 interrupt to the HPI port.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### SOF/EOP1 to CPU Enable (Bit 10)

The SOF/EOP1 to CPU Enable bit routes the SOF/EOP1 interrupt to the on-chip CPU. Since the SOF/EOP1 interrupt can be routed to both the on-chip CPU and the HPI port the firmware must ensure only one of the two (CPU, HPI) resets the interrupt.

1: Route signal to CPU

0: Do not route signal to CPU

#### Reset2 to HPI Enable (Bit 9)

The Reset2 to HPI Enable bit routes the USB Reset interrupt that occurs on Device 2 to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

**0:** Do not route signal to HPI port

#### HPI Swap 1 Enable (Bit 8)

Both HPI Swap bits (bits 8 and 0) must be set to identical values. When set to '00', the most significant data byte goes to HPI\_D[15:8] and the least significant byte goes to HPI\_D[7:0]. This is the default setting. By setting to '11', the most significant data byte goes to HPI\_D[7:0] and the least significant byte goes to HPI\_D[15:8].

#### Resume2 to HPI Enable (Bit 7)

The Resume2 to HPI Enable bit routes the USB Resume interrupt that occurs on Host 2 to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### Resume1 to HPI Enable (Bit 6)

The Resume1 to HPI Enable bit routes the USB Resume interrupt that occurs on Host 1 to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### Done2 to HPI Enable (Bit 3)

The Done2 to HPI Enable bit routes the Done interrupt for Host/Device 2 to the HPI port instead of the on-chip CPU.

- 1: Route signal to HPI port
- 0: Do not route signal to HPI port

#### Done1 to HPI Enable (Bit 2)

The Done1 to HPI Enable bit routes the Done interrupt for Host/Device 1 to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

0: Do not route signal to HPI port

#### Reset1 to HPI Enable (Bit 1)

The Reset1 to HPI Enable bit routes the USB Reset interrupt that occurs on Device 1 to the HPI port instead of the on-chip CPU.

1: Route signal to HPI port

0: Do not route signal to HPI port

# HPI Swap 0 Enable (Bit 0)

Both HPI Swap bits (bits 8 and 0) must be set to identical values. When set to '00', the most significant data byte goes to HPI\_D[15:8] and the least significant byte goes to HPI\_D[7:0]. This is the default setting. By setting to '11', the most significant data byte goes to HPI\_D[7:0] and the least significant byte goes to HPI\_D[15:8].

## SIEXmsg Register [W]

- SIE1msg Register 0x0144
- SIE2msg Register 0x0148

# Figure 58. SIEXmsg Register

| Bit #      | 15   | 14 | 13 | 12 | 11  | 10 | 9 | 8 |  |  |
|------------|------|----|----|----|-----|----|---|---|--|--|
| Field      | Data |    |    |    |     |    |   |   |  |  |
| Read/Write | W    | W  | W  | W  | W   | W  | W | W |  |  |
| Default    | Х    | Х  | Х  | Х  | Х   | Х  | Х | Х |  |  |
|            |      |    |    |    |     |    |   |   |  |  |
| Bit #      | 7    | 6  | 5  | 4  | 3   | 2  | 1 | 0 |  |  |
| Field      |      |    |    | C  | ata |    |   |   |  |  |
| Read/Write | W    | W  | W  | W  | W   | W  | W | W |  |  |
| Default    | Х    | Х  | Х  | Х  | Х   | Х  | Х | Х |  |  |

#### **Register Description**

The SIEXmsg register allows an interrupt to be generated on the HPI port. Any write to this register causes the SIEXmsg flag in the HPI Status Port to go high and also causes an interrupt on the HPI\_INTR pin. The SIEXmsg flag is automatically cleared when the HPI port reads from this register.

## Data (Bits [15:0])

The Data field[15:0] simply must have any value written to it to cause SIExmsg flag in the HPI Status Port to go high.

#### HPI Mailbox Register [0xC0C6] [R/W]

#### Figure 59. HPI Mailbox Register

| Bit #      | 15      | 14  | 13  | 12  | 11    | 10  | 9   | 8   |  |  |
|------------|---------|-----|-----|-----|-------|-----|-----|-----|--|--|
| Field      | Message |     |     |     |       |     |     |     |  |  |

| Default    | 0       | 0   | 0   | 0   | 0     | 0   | 0   | 0   |  |  |

#### **Register Description**

The HPI Mailbox register provides a common mailbox between the CY7C67200 and the external host processor.

If enabled, the HPI Mailbox RX Full interrupt triggers when the external host processor writes to this register. When the CY7C67200 reads this register the HPI Mailbox RX Full interrupt automatically gets cleared.

If enabled, the HPI Mailbox TX Empty interrupt triggers when the external host processor reads from this register. The HPI Mailbox TX Empty interrupt is automatically cleared when the CY7C67200 writes to this register.

In addition, when the CY7C67200 writes to this register, the HPI\_INTR signal on the HPI port asserts signaling the external processor that there is data in the mailbox to read. The HPI\_INTR signal deasserts when the external host processor reads from this register.

#### Message (Bits [15:0])

The Message field contains the message that the host processor wrote to the HPI Mailbox register.

# HPI Status Port [] [HPI: R]

#### Figure 60. HPI Status Port

| Bit #      | 15              | 14              | 13       | 12               | 11            | 10               | 9              | 8                   |

#### **Register Description**

The HPI Status Port provides the external host processor with the MailBox status bits plus several SIE status bits. This register is not accessible from the on-chip CPU. The additional SIE status bits are provided to aid external device driver firmware development, and are not recommended for applications that do not have an intimate relationship with the on-chip BIOS.

Reading from the HPI Status Port does not result in a CPU HPI interface memory access cycle. The external host may continuously poll this register without degrading the CPU or DMA performance.

#### VBUS Flag (Bit 15)

The VBUS Flag bit is a read-only bit that indicates whether OTG VBus is greater than 4.4 V. After turning on VBUS, firmware should wait at least 10 µs before this reading this bit.

1: OTG VBus is greater then 4.4 V

0: OTG VBus is less then 4.4 V

#### ID Flag (Bit 14)

The ID Flag bit is a read-only bit that indicates the state of the OTG ID pin.

#### SOF/EOP2 Flag (Bit 12)

The SOF/EOP2 Flag bit is a read-only bit that indicates if a SOF/EOP interrupt occurs on either Host/Device 2.

1: Interrupt triggered

0: Interrupt did not trigger

#### SOF/EOP1 Flag (Bit 10)

The SOF/EOP1 Flag bit is a read-only bit that indicates if a SOF/EOP interrupt occurs on either Host/Device 1.

1: Interrupt triggered

0: Interrupt did not trigger

#### Reset2 Flag (Bit 9)

The Reset2 Flag bit is a read-only bit that indicates if a USB Reset interrupt occurs on either Host/Device 2.

1: Interrupt triggered

0: Interrupt did not trigger

#### Mailbox In Flag (Bit 8)

The Mailbox In Flag bit is a read-only bit that indicates if a message is ready in the incoming mailbox. This interrupt clears when on-chip CPU reads from the HPI Mailbox register.

1: Interrupt triggered

**0:** Interrupt did not trigger

#### Resume2 Flag (Bit 7)

The Resume2 Flag bit is a read-only bit that indicates if a USB resume interrupt occurs on either Host/Device 2.

1: Interrupt triggered

0: Interrupt did not trigger

#### Resume1 Flag (Bit 6)

The Resume1 Flag bit is a read-only bit that indicates if a USB resume interrupt occurs on either Host/Device 1.

1: Interrupt triggered

**0:** Interrupt did not trigger

#### SIE2msg (Bit 5)

The SIE2msg Flag bit is a read-only bit that indicates if the CY7C67200 CPU has written to the SIE2msg register. This bit is cleared on an HPI read.

**1:** The SIE2msg register has been written by the CY7C67200 CPU

**0**: The SIE2msg register has not been written by the CY7C67200 CPU

#### SIE1msg (Bit 4)

The SIE1msg Flag bit is a read-only bit that indicates if the CY7C67200 CPU has written to the SIE1msg register. This bit is cleared on an HPI read.

**1:** The SIE1msg register has been written by the CY7C67200 CPU

**0:** The SIE1msg register has not been written by the CY7C67200 CPU

# Done2 Flag (Bit 3)

In host mode the Done2 Flag bit is a read-only bit that indicates if a host packet done interrupt occurs on Host 2. In device mode this read only bit indicates if any of the endpoint interrupts occurs on Device 2. Firmware needs to determine which endpoint interrupt occurred.

- 1: Interrupt triggered
- 0: Interrupt did not trigger

#### Done1 Flag (Bit 2)

In host mode the Done 1 Flag bit is a read-only bit that indicates if a host packet done interrupt occurs on Host 1. In device mode this read-only bit indicates if any of the endpoint interrupts occurs on Device 1. Firmware needs to determine which endpoint interrupt occurred.

- 1: Interrupt triggered
- **0:** Interrupt did not trigger

#### Reset1 Flag (Bit 1)

The Reset1 Flag bit is a read-only bit that indicates if a USB Reset interrupt occurs on either Host/Device 1.

- 1: Interrupt triggered
- 0: Interrupt did not trigger

#### Mailbox Out Flag (Bit 0)

The Mailbox Out Flag bit is a read-only bit that indicates if a message is ready in the outgoing mailbox. This interrupt clears when the external host reads from the HPI Mailbox register.

- 1: Interrupt triggered
- 0: Interrupt did not trigger

## **SPI Registers**

There are 12 registers dedicated to SPI operation. Each register is covered in this section and summarized in Table 33.

# Table 33. SPI Registers

| Register Name                 | Address | R/W |
|-------------------------------|---------|-----|
| SPI Configuration Register    | 0xC0C8  | R/W |
| SPI Control Register          | 0xC0CA  | R/W |
| SPI Interrupt Enable Register | 0xC0CC  | R/W |
| SPI Status Register           | 0xC0CE  | R   |
| SPI Interrupt Clear Register  | 0xC0D0  | W   |
| SPI CRC Control Register      | 0xC0D2  | R/W |
| SPI CRC Value                 | 0xC0D4  | R/W |
| SPI Data Register             | 0xC0D6  | R/W |
| SPI Transmit Address Register | 0xC0D8  | R/W |
| SPI Transmit Count Register   | 0xC0DA  | R/W |
| SPI Receive Address Register  | 0xC0DC  | R/W |
| SPI Receive Count Register    | 0xC0DE  | R/W |

#### SPI Configuration Register [0xC0C8] [R/W]

#### Figure 61. SPI Configuration Register

| Bit #      | 15                      | 14               | 13                     | 12  | 11           | 10              | 9   | 8   |  |
|------------|-------------------------|------------------|------------------------|-----|--------------|-----------------|-----|-----|--|
| Field      | 3Wire<br>Enable         | Phase<br>Select  | SCK Polarity<br>Select |     | Scale Select |                 |     |     |  |
| Read/Write | R/W                     | R/W              | R/W                    | R/W | R/W          | R/W             | R/W | -   |  |
| Default    | 1                       | 0                | 0                      | 0   | 0            | 0               | 0   | 0   |  |
|            |                         |                  |                        |     |              |                 |     |     |  |
| Bit #      | 7                       | 6                | 5                      | 4   | 3            | 2               | 1   | 0   |  |
| Field      | Master<br>Active Enable | Master<br>Enable | SS<br>Enable           |     |              | SS Delay Select | t   |     |  |
| Read/Write | R                       | R/W              | R/W                    | R/W | R/W          | R/W             | R/W | R/W |  |
| Default    | 0                       | 0                | 0                      | 1   | 1            | 1               | 1   | 1   |  |

The SPI Configuration register controls the SPI port. Fields apply to both master and slave mode unless otherwise noted.

#### 3Wire Enable (Bit 15)

The 3Wire Enable bit indicates if the MISO and MOSI data lines are tied together allowing only half duplex operation.

1: MISO and MOSI data lines are tied together

**0**: Normal MISO and MOSI Full Duplex operation (not tied together)

#### Phase Select (Bit 14)

The Phase Select bit selects advanced or delayed SCK phase. This field only applies to master mode.

1: Advanced SCK phase

0: Delayed SCK phase

#### SCK Polarity Select (Bit 13)

This SCK Polarity Select bit selects the polarity of SCK.

1: Positive SCK polarity

0: Negative SCK polarity

#### Scale Select (Bits [12:9])

The Scale Select field provides control over the SCK frequency, based on 48 MHz. See Table 34 for a definition of this field. This field only applies to master mode.

#### Table 34. Scale Select Field Definition for SCK Frequency

| Scale Select [12:9] | SCK Frequency |  |  |  |  |  |
|---------------------|---------------|--|--|--|--|--|
| 0000                | 12 MHz        |  |  |  |  |  |
| 0001                | 8 MHz         |  |  |  |  |  |
| 0010                | 6 MHz         |  |  |  |  |  |
| 0011                | 4 MHz         |  |  |  |  |  |
| 0100                | 3 MHz         |  |  |  |  |  |
| 0101                | 2 MHz         |  |  |  |  |  |
| 0110                | 1.5 MHz       |  |  |  |  |  |
| 0111                | 1 MHz         |  |  |  |  |  |
| 1000                | 750 KHz       |  |  |  |  |  |
| 1001                | 500 KHz       |  |  |  |  |  |
| 1010                | 375 KHz       |  |  |  |  |  |
| 1011                | 250 KHz       |  |  |  |  |  |
| 1100                | 375 KHz       |  |  |  |  |  |
| 1101                | 250 KHz       |  |  |  |  |  |
| 1110                | 375 KHz       |  |  |  |  |  |
| 1111                | 250 KHz       |  |  |  |  |  |
|                     |               |  |  |  |  |  |

# Master Active Enable (Bit 7)

The Master Active Enable bit is a read-only bit that indicates if the master state machine is active or idle. This field only applies to master mode.

1: Master state machine is active

0: Master state machine is idle

#### Master Enable (Bit 6)

The Master Enable bit sets the SPI interface to master or slave. This bit is only writable when the Master Active Enable bit reads '0', otherwise value will not change.

1: Master SPI interface

0: Slave SPI interface

#### SS Enable (Bit 5)

The SS Enable bit enables or disables the master SS output.

1: Enable master SS output

**0**: Disable master SS output (three-state master SS output, for single SS line in slave mode)

#### SS Delay Select (Bits [4:0])

When the SS Delay Select field is set to '00000' this indicates manual mode. In manual mode SS is controlled by the SS Manual bit of the SPI Control register. When the SS Delay Select field is set between '00001' to '11111', this value indicates the count in half bit times of auto transfer delay for: SS LOW to SCK active, SCK inactive to SS HIGH, SS HIGH time. This field only applies to master mode.

# SPI Control Register [0xC0CA] [R/W]

#### Figure 62. SPI Control Register

| Bit #      | 15                | 14              | 13                                     | 12          | 11           | 10             | 9                 | 8                     |
|------------|-------------------|-----------------|--|-------------|--------------|----------------|-------------------|-----------------------|
| Field      | SCK<br>Strobe     | FIFO<br>Init    | Byte<br>Mode                           | Full Duplex | SS<br>Manual | Read<br>Enable | Transmit<br>Ready | Receive<br>Data Ready |
| Read/Write | W                 | W               | R/W                                    | R/W         | R/w          | R/W            | R                 | R                     |
| Default    | 0                 | 0               | 0                                      | 0           | 0            | 0              | 0                 | 1                     |
| -          |                   |                 |  |             |              |                |                   |                       |
| Bit #      | 7                 | 6               | 5                                      | 4           | 3            | 2              | 1                 | 0                     |
| Field      | Transmit<br>Empty | Receive<br>Full | Transmit Bit Length Receive Bit Length |             |              |                | th                |                       |
| Read/Write | R                 | R               | R/W                                    | R/W         | R/W          | R/W            | R/w               | R/W                   |
| Default    | 1                 | 0               | 0                                      | 0           | 0            | 0              | 0                 | 0                     |

#### **Register Description**

The SPI Control register controls the SPI port. Fields apply to both master and slave mode unless otherwise noted.

#### SCK Strobe (Bit 15)

The SCK Strobe bit starts the SCK strobe at the selected frequency and polarity (set in the SPI Configuration register), but not phase. This bit feature can only be enabled when in master mode and must be during a period of inactivity. This bit is self-clearing.

1: SCK Strobe Enable

0: No Function

#### FIFO Init (Bit 14)

The FIFO Init bit initializes the FIFO and clear the FIFO Error Status bit. This bit is self-clearing.

1: FIFO Init Enable

0: No Function

#### Byte Mode (Bit 13)

The Byte Mode bit selects between PIO (byte mode) and DMA (block mode) operation.

1: Set PIO (byte mode) operation

0: Set DMA (block mode) operation

#### Full Duplex (Bit 12)

The Full Duplex bit selects between full-duplex and half-duplex operation.

1: Enable full duplex. Full duplex is not allowed and will not set if the 3Wire Enable bit of the SPI Configuration register is set to '1'

0: Enable half-duplex operation

#### SS Manual (Bit 11)

The SS Manual bit activates or deactivates SS if the SS Delay Select field of the SPI Control register is all zeros and is configured as master interface. This field only applies to master mode.

1: Activate SS, master drives SS line asserted LOW

0: Deactivate SS, master drives SS line deasserted HIGH

#### Read Enable (Bit 10)

The Read Enable bit initiates a read phase for a master mode transfer or set the slave to receive (in slave mode).

1: Initiates a read phase for a master transfer or sets a slave to receive. In master mode this bit is sticky and remains set until the read transfer begins.

0: Initiates the write phase for slave operation

#### Transmit Ready (Bit 9)

The Transmit Ready bit is a read-only bit that indicates if the transmit port is ready to empty and ready to be written.

**1:** Ready for data to be written to the port. The transmit FIFO is not full.

**0**: Not ready for data to be written to the port

#### Receive Data Ready (Bit 8)

The Receive Data Ready bit is a read-only bit that indicates if the receive port has data ready.

- 1: Receive port has data ready to read
- 0: Receive port does not have data ready

#### Transmit Empty (Bit 7)

The Transmit Empty bit is a read-only bit that indicates if the transmit FIFO is empty.

- **1:** Transmit FIFO is empty
- 0: Transmit FIFO is not empty

#### Receive Full (Bit 6)

The Receive Full bit is a read-only bit that indicates if the receive FIFO is full.

1: Receive FIFO is full

0: Receive FIFO is not full

#### Transmit Bit Length (Bits [5:3])

The Transmit Bit Length field controls whether a full byte or partial byte is to be transmitted. If Transmit Bit Length is '000', a full byte is transmitted. If Transmit Bit Length is '001' to '111', the value indicates the number of bits that will be transmitted.

# Receive Bit Length (Bits [2:0])

The Receive Bit Length field controls whether a full byte or partial byte will be received. If Receive Bit Length is '000' then a full byte will be received. If Receive Bit Length is '001' to '111', then the value indicates the number of bits that will be received.

# SPI Interrupt Enable Register [0xC0CC] [R/W]

#### Figure 63. SPI Interrupt Enable Register

| Read/Write | - |   |          |   |                             |                              | R/W                          | R/W |
| Default    | 0 | 0 | 0        | 0 | 0                           | 0                            | 0                            | 0   |

#### **Register Description**

The SPI Interrupt Enable register controls the SPI port.

#### Receive Interrupt Enable (Bit 2)

The Receive Interrupt Enable bit enables or disables the byte mode receive interrupt (RxIntVal).

- 1: Enable byte mode receive interrupt
- 0: Disable byte mode receive interrupt

#### Transmit Interrupt Enable (Bit 1)

The Transmit Interrupt Enable bit enables or disables the byte mode transmit interrupt (TxIntVal).

1: Enables byte mode transmit interrupt

0: Disables byte mode transmit interrupt

#### Transfer Interrupt Enable (Bit 0)

The Transfer Interrupt Enable bit enables or disables the block mode interrupt (XfrBlkIntVal).

1: Enables block mode interrupt

0: Disables block mode interrupt

#### Reserved

All reserved bits must be written as '0'.

The SPI Status register is a read only register that provides status for the SPI port.

## FIFO Error Flag (Bit 7)

The FIFO Error Flag bit is a read only bit that indicates if a FIFO error occurred. When this bit is set to '1' and the Transmit Empty bit of the SPI Control register is set to '1', then a Tx FIFO underflow has occurred. Similarly, when set with the Receive Full bit of the SPI Control register, a Rx FIFO overflow has occured. This bit automatically clear when the SPI FIFO Init Enable bit of the SPI Control register is set.

1: Indicates FIFO error

0: Indicates no FIFO error

#### Receive Interrupt Flag (Bit 2)

#### SPI Interrupt Clear Register [0xC0D0] [W]

# Figure 65. SPI Interrupt Clear Register

The Receive Interrupt Flag is a read only bit that indicates if a byte mode receive interrupt has triggered.

Indicates a byte mode receive interrupt has triggered
 Indicates a byte mode receive interrupt has not triggered

# Transmit Interrupt Flag (Bit 1)

The Transmit Interrupt Flag is a read only bit that indicates a byte mode transmit interrupt has triggered.

1: Indicates a byte mode transmit interrupt has triggered

**0**: Indicates a byte mode transmit interrupt has not triggered

#### Transfer Interrupt Flag (Bit 0)

The Transfer Interrupt Flag is a read only bit that indicates a block mode interrupt has triggered.

1: Indicates a block mode interrupt has triggered

0: Indicates a block mode interrupt has not triggered

# **Register Description**

The SPI Interrupt Clear register is a write-only register that allows the SPI Transmit and SPI Transfer Interrupts to be cleared.

# Transmit Interrupt Clear (Bit 1)

The Transmit Interrupt Clear bit is a write-only bit that clears the byte mode transmit interrupt. This bit is self-clearing.

1: Clear the byte mode transmit interrupt

0: No function

SPI CRC Control Register [0xC0D2] [R/W]

# Figure 66. SPI CRC Control Register

# Transfer Interrupt Clear (Bit 0)

The Transfer Interrupt Clear bit is a write-only bit that will clear the block mode interrupt. This bit is self clearing.

1: Clear the block mode interrupt

0: No function

# Reserved

All reserved bits must be written as '0'.

| Bit #      | 15  | 14   | 13            | 12           | 11             | 10            | 9              | 8        |

| Read/Write | -   | -    | -             | -            | -              | -             | -              | -        |
| Default    | 0   | 0    | 0             | 0            | 0              | 0             | 0              | 0        |

The SPI CRC Control register provides control over the CRC source and polynomial value.

## **CRC Mode** (Bits [15:14)

The CRCMode field selects the CRC polynomial as defined in Table 35.

# Table 35. CRC Mode Definition

| CRCMode<br>[9:8] | CRC Polynomial  |
|------------------|---|
| 00               | MMC 16-bit: X^16 + X^12 + X^5 + 1<br>(CCITT Standard) |
| 01               | CRC7 7-bit: X^7+ X^3 + 1                              |
| 10               | MST 16-bit: X^16+ X^15 + X^2 + 1                      |
| 11               | Reserved, 16-bit polynomial 1.                        |

# CRC Enable (Bit 13)

The CRC Enable bit enables or disables the CRC operation.

1: Enables CRC operation

0: Disables CRC operation

# CRC Clear (Bit 12)

The CRC Clear bit will clear the CRC with a load of all ones. This bit is self clearing and always reads '0'.

SPI CRC Value Register [0xC0D4] [R/W]

#### Figure 67. SPI CRC Value Register

1: Clear CRC with all ones

0: No Function

# Receive CRC (Bit 11)

The Receive CRC bit determines whether the receive bit stream or the transmit bit stream is used for the CRC data input in full duplex mode. This bit is a don't care in half-duplex mode.

1: Assigns the receive bit stream

0: Assigns the transmit bit stream

#### One in CRC (Bit 10)

The One in CRC bit is a read-only bit that indicates if the CRC value is all zeros or not.

1: CRC value is not all zeros

**0:** CRC value is all zeros

# Zero in CRC (Bit 9)

The Zero in CRC bit is a read-only bit that indicates if the CRC value is all ones or not.

1: CRC value is not all ones

0: CRC value is all ones

#### Reserved

All reserved bits must be written as '0'.

| Bit #      | 15  | 14       | 13  | 12  | 11  | 10  | 9   | 8   |  |  |  |  |  |

#### **Register Description**

The SPI CRC Value register contains the CRC value.

#### CRC (Bits [15:0])

The CRC field contains the SPI CRC. In CRC Mode CRC7, the CRC value will be a seven bit value [6:0]. Therefore bits [15:7] are invalid in CRC7 mode.

#### **Register Description**

The SPI Data register contains data received on the SPI port when read. Reading it empties the eight byte receive FIFO in PIO byte mode. This receive data is valid when the receive bit of the SPI Interrupt Value is set to '1' (RxIntVal triggers) or the Receive Data Ready bit of the SPI Control register is set to '1'. Writing to this register in PIO byte mode will initiate a transfer of data, the number of bits defined by Transmit Bit Length field in the SPI Control register.

#### Data (Bits [7:0])

The Data field contains data received or to be transmitted on the SPI port.

#### Reserved

All reserved bits must be written as '0'.

#### **Register Description**

The UART Control register enables or disables the UART allowing GPIO7 (UART\_TXD) and GPIO6 (UART\_RXD) to be freed up for general use. This register must also be written to set the baud rate, which is based on a 48-MHz clock.

#### Scale Select (Bit 4)

The Scale Select bit acts as a prescaler that will divide the baud rate by eight.

1: Enable prescaler

0: Disable prescaler

# Baud Select (Bits [3:1])

Refer to Table 37 for a definition of this field.

#### Table 37. UART Baud Select Definition

| Baud Select [3:1] | Baud Rate<br>w/DIV8 = 0 | Baud Rate<br>w/DIV8 = 1 |
|-------------------|-------------------------|-------------------------|
| 000               | 115.2K baud             | 14.4K baud              |
| 001               | 57.6K baud              | 7.2K baud               |
| 010               | 38.4K baud              | 4.8K baud               |
| 011               | 28.8K baud              | 3.6K baud               |
| 100               | 19.2K baud              | 2.4K baud               |
| 101               | 14.4K baud              | 1.8K baud               |
| 110               | 9.6K baud               | 1.2K baud               |
| 111               | 7.2K baud               | 0.9K baud               |

#### UART Enable (Bit 0)

The UART Enable bit enables or disables the UART.

1: Enable UART

**0:** Disable UART. This allows GPIO6 and GPIO7 to be used for general use

# Reserved

All reserved bits must be written as '0'.

UART Status Register [0xC0E2] [R]

| Default    | 0        | 0  | 0   | 0     | 0  | 0  | 0            | 0             |

#### **Register Description**

The UART Status register is a read-only register that indicates the status of the UART buffer.

#### Receive Full (Bit 1)

The Receive Full bit indicates whether the receive buffer is full. It can be programmed to interrupt the CPU as interrupt #5 when the buffer is full. This can be done though the UART bit of the Interrupt Enable register (0xC00E). This bit will automatically be cleared when data is read from the UART Data register.

1: Receive buffer full

0: Receive buffer empty

# Transmit Full (Bit 0)

The Transmit Full bit indicates whether the transmit buffer is full. It can be programmed to interrupt the CPU as interrupt #4 when the buffer is empty. This can be done though the UART bit of the Interrupt Enable register (0xC00E). This bit will automatically be set to '1' after data is written by EZ-Host to the UART Data register (to be transmitted). This bit will automatically be cleared to '0' after the data is transmitted.

1: Transmit buffer full (transmit busy)

0: Transmit buffer is empty and ready for a new byte of data

# **Register Description**

The UART Data register contains data to be transmitted or received from the UART port. Data written to this register will start a data transmission and also causes the UART Transmit Empty Flag of the UART Status register to set. When data received on the UART port is read from this register, the UART Receive Full Flag of the UART Status register will be cleared.

## Data (Bits [7:0])

The Data field is where the UART data to be transmitted or received is located

#### Reserved

All reserved bits must be written as '0'.

Notes
 All tests were conducted with Charge pump off.
 I<sub>CC</sub> and I<sub>CCB</sub> values are the same regardless of USB host or peripheral configuration.
 There is no appreciable difference in I<sub>CC</sub> and I<sub>CCB</sub> values when only one transceiver is powered.

# **USB Transceiver**

USB 2.0-compatible in full- and low-speed modes.

This product was tested as compliant to the USB-IF specification under the test identification number (TID) of 100390449 and is listed on the USB-IF's integrators list.

# **HSS BYTE Mode Transmit**

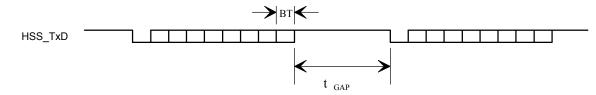

qt\_clk, CPU\_A, CPUHSS\_cs, CPU\_wr are internal signals, included in the diagram to illustrate relationship between CPU operations and HSS port operations.

Bit 0 is LSB of data byte. Data bits are HIGH true: HSS\_TxD HIGH = data bit value '1'.

BT = bit time = 1/baud rate.

# HSS Block Mode Transmit

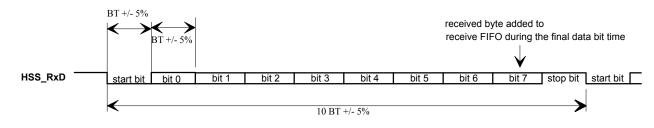

BLOCK mode transmit timing is similar to BYTE mode, except the STOP bit time is controlled by the HSS\_GAP value. The BLOCK mode STOP bit time,  $t_{GAP} = (HSS_GAP - 9)$  BT, where BT is the bit time, and HSS\_GAP is the content of the HSS Transmit Gap register 90xC074].

The default t<sub>GAP</sub> is 2 BT.

BT = bit time = 1/baud rate.

# **HSS BYTE and BLOCK Mode Receive**

Receive data arrives asynchronously relative to the internal clock.

Incoming data bit rate may deviate from the programmed baud rate clock by as much as  $\pm 5\%$  (with HSS\_RATE value of 23 or higher).

BYTE mode received bytes are buffered in a FIFO. The FIFO not empty condition becomes the RxRdy flag.

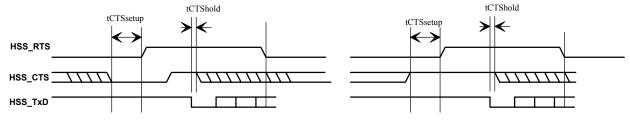

BLOCK mode received bytes are written directly to the memory system.

Bit 0 is LSB of data byte. Data bits are HIGH true: HSS\_RxD HIGH = data bit value '1'.

BT = bit time = 1/baud rate.

# Hardware CTS/RTS Handshake

Start of transmission delayed until HSS\_CTS goes high

Start of transmission not delayed by HSS\_CTS

 $t_{CTSset-up}$ : HSS\_CTS setup time before HSS\_RTS = 1.5T min.

 $t_{CTShold}$ : HSS\_CTS hold time after START bit = 0 ns min.

T = 1/48 MHz.

When RTS/CTS hardware handshake is enabled, transmission can be held off by deasserting HSS\_CTS at least 1.5T before HSS\_RTS. Transmission resumes when HSS\_CTS returns HIGH. HSS\_CTS must remain HIGH until START bit.

HSS\_RTS is deasserted in the third data bit time.

An application may choose to hold HSS\_CTS until HSS\_RTS is deasserted, which always occurs after the START bit.

# **Register Summary**

# Table 42. Register Summary

# Appendix: Silicon Errata for the EZ-OTG<sup>™</sup> Programmable USB On-The-Go Host/Peripheral Controller, CY7C67200 Product Family

This section describes the errata for the CY7C67200. Details include errata trigger conditions, scope of impact, available workarounds, and silicon revision applicability.

Contact your local Cypress Sales Representative if you have questions.

# Part Numbers Affected

| Part Number | Device Characteristics |
|-------------|------------------------|
| CY7C67200   | All Packages           |

### CY7C67200 Qualification Status

In Production

### CY7C67200 Errata Summary

The following table defines the errata applicability to available CY7C67200 family devices. An "X" indicates that the errata pertains to the selected device.

Note Errata items, in the table below, are hyperlinked. Click on any item entry to jump to its description.

| Items  | CY7C67200 | Silicon<br>Revision | Fix Status   |
|--|-----------|---------------------|--|

# 1. HPI Write to SIE Registers

## Problem Definition

Writing to the SIE2 Control register via HPI can corrupt the SIE1 control register.

Writing to the SIE1 Control register via HPI can corrupt the SIE2 control register.

# Parameters Affected

SIE control registers

# Trigger Condition(S)

When an external processor accesses the SIE1 or SIE2 register at the same time the internal CY16 CPU is also accessing the opposite SIE, the SIE accessed by the CY16 CPU will be corrupted.

For example, the external processor writes a value of 0x80 to the SIE2 register 0xC0B0 while the internal CY16 is doing a read/write to the SIE1 register 0xC08C, the SIE1 register 0xC08C, will be corrupted with the value 0x80.

### Scope of Impact

If the internal CPU and external CPU access the SIEs at the same time, contention will occur resulting in incorrect data in one of the SIE registers.

### Workaround

- 1. Use the LCP COMM\_WRITE\_CTRL\_REG to handle the writing to SIE registers.
- 2. Use download code to handle SIE WRITE commands.
- 3. Avoid accessing SIE register from the external CPU. For example: Route all the SIE interrupts to the software mailbox interrupt registers 0x144 and 0x148. This requires user to create download code.

### Fix Status

Use workaround. No fix is currently planned for future silicon revisions. An implementation example is included in the Cypress Windows CE driver.

### 2. IDE Register Read When GPIO24 Pin is Low

### Problem Definition

Part does not service USB ISRs when GPIO24 pin (also labeled as HPI\_INT and IORDY) is low and any IDE register is read.

## Parameters Affected

USB ISRs do not get serviced.

### Trigger Conditions

The IDE registers (0xC050 through 0xC06E) should not be read unless IDE is being used. Debuggers that read all memory locations while single stepping can cause this situation to manifest itself.

## Scope of Impact

If debugging and using this pin, your application will appear to hang.

### Workaround

When running in stand-alone mode, avoid using the GPIO24 pin if possible.

### Fix Status

Other workarounds being investigated. No fix is currently planned for future silicon revisions.

#### 3. UART Does Not Recognize Framing Errors

### Problem Definition

The UART is not designed to recognize framing errors.

#### Parameters Affected

UART serial communications.

## Trigger Conditions

Some platforms can cause EZ-OTG to see a string of NULL characters and cause the UART to get out of sync.

#### Scope of Impact

This can cause the UART to lose connection with the host during serial communications. One example of this is if the UART is used as the debug port to the PC. This problem has occurred on, but is not limited to, Dell machines running WinXP or Win2k.

#### Workaround

For general use, there is no workaround. If this problem is experienced while debugging, try running the debugger on a different Host (PC/OS). Otherwise the USB port can be used for the debugging interface.

#### Fix Status

No fix is currently planned for future silicon versions.

#### 4. UART Does Not Override GPIO Control Register

## Problem Definition

When the UART is enabled, the GPIO Control Register still has control over GPIO 6 (UART RX pin). When enabled, the UART should override the GPIO Control Register, which defaults to setting the pin as an input.

#### Parameters Affected

UART serial communications.

## Trigger Conditions

**Enabling UART** 

#### ■ Scope of Impact

GPIO 6 UART RX pin is controlled by GPIO Control Register and defaults to an input. The UART mode does not override the GPIO control register for this pin and can be inadvertently configured as an output.

#### Workaround

Ensure the GPIO Control Register is written appropriately to set GPIO6 as an input when the UART is enabled.

#### Fix Status

No fix is currently planned for future silicon versions.

# 5. VBUS Interrupt (VBUS Valid) Requires Debouncing

#### Problem Definition

The VBUS interrupt in the Host/Device Status Registers [0xC090 and 0xC0B0] and OTG Control Register [0xC098] triggers multiple times whenever VBUS is turned on. It should only trigger once when VBUS rises above 4.4 V and once when VBUS falls from above 4.4 V to 0 V.

#### Parameters Affected

Electrical.

#### Trigger Conditions

VBUS turned on.

## Scope of Impact

Host/Device Registers and OTG Control Register trigger multiple times.

#### Workaround

When reading the status of this interrupt, a software debounce should be implemented.

#### Fix Status

No fix is currently planned for future silicon versions.

### 6. Coupled SIE Interrupt Enable Bits

#### Problem Definition

Host/Device 1 SIE events will still trigger an interrupt when only the Host/Device 2 SIE Interrupt Enable is set and vise versa.

### Parameters Affected

Host/Device SIE Interrupts.

## Trigger Conditions

Setting only 1 Host/Device SIE Interrupt Enable.

#### Scope of Impact

The Host/Device global Interrupt Enable bits can not be used to disable each Host/Device SIE independently. These bits are found in the Interrupt Enable Register (0xC00E).

### Workaround

If an SIE Interrupt is desired, both Host/Device 1 and Host/Device 2 Interrupt Enable bits should be set in the global Interrupt Enable Register (0xC00E). To properly mask an SIE Interrupt to a single SIE, the lower level Host/Device Interrupt Enable Registers (0xC08C and 0xC0AC) must be used. For example, setting the Host/Device 2 IE Register to 0x0000 will prevent any Host/Device 2 events from generating a Host/Device Interrupt. To disable all SIE interrupts, both Host/Device Interrupt Enable bits in the Interrupt Enable Register should be cleared.

#### Fix Status

No fix is currently planned for future silicon versions. Examples provided in the Development Kit Software.

#### 7. Un-Initialized SIExmsg Registers

#### Problem Definition

The SIE1msg and SIE2msg Registers [0x0144 and 0x0148] are not initialized at power up.

#### Parameters Affected

HPI interrupts.

# Trigger Conditions

Power-up initialization.

#### Scope of Impact

If using the HPI interface in coprocessor mode, random data will be written to the SIE1msg and SIE2msg Registers [0x0144 and 0x0148] at power up. This will cause two improper HPI interrupts (HPI\_INTR) to occur, one for each of the two SIExmsg Registers.

#### Workaround

The external processor should clear the SIExmsg Registers [0x0144 and 0x0148] shortly after nRESET is de-asserted and prior to the expected processing of proper HPI interrupts (generally 10ms after nRESET is de-asserted.)

#### Fix Status

No fix is currently planned for future silicon versions.

#### 8. BIOS USB Peripheral Mode: Descriptor Length

#### Problem Definition

The BIOS will not properly return a descriptor or set of descriptors if the length is a multiple of the control endpoint's maximum packet size.

#### Parameters Affected

Control Endpoint maximum packet size.

# Trigger Conditions

Get Descriptor requests.

#### ■ Scope of Impact

If the descriptor length is a multiple of the maximum packet size, the BIOS will respond with a STALL instead of a zero-length data packet for the final IN request.

#### Workaround

If the requested descriptor length is a multiple of the maximum packet size, then either the maximum packet size or the descriptor length needs to change. A descriptor length can be increased by simply adding a padded byte to the end of a descriptor and increasing the descriptor Length byte by one. Section 9.5 (Descriptor) of the USB2.0 specification allows a descriptor length to be larger than the value defined in the specification.

#### Fix Status

No fix is currently planned for future silicon versions.

#### 9. Peripheral Short Packet Issue

#### Problem Definition

When a SIE is configured as a peripheral, the SUSBx\_RECEIVE function does not invoke the callback function when it receives a short packet.

#### Parameters Affected

SIEx Endpoint x Interrupt (Interrupt 32-47).

#### Trigger Conditions

This issue is seen when a SIE is configured as a peripheral during an OUT data transfer when the host sends a zero length or short packet. If this occurs the BIOS will behave as if a full packet was received and will continue to accept data until the Device n Endpoint n Count Register value is satisfied.

#### Scope of Impact

All peripheral functions are susceptible to this as it is a normal occurrence with USB traffic.

#### Workaround

To fix this problem the SIEx Endpoint x Interrupt must be replaced for any peripheral endpoint that is configured as an OUT endpoint.

- 1. Acquire the file called susb1.s from Cypress Support or by downloading a newer version of the frameworks that has had this fix applied and includes susb1.s.
- 2. Modify fwxcfg.h in your project to have the following flags and define/undef the fix for the endpoints you are using:

```
#define FIX_USB1_EP1
#define FIX_USB1_EP2
#undef FIX_USB1_EP3
#undef FIX_USB1_EP4
#undef FIX_USB1_EP5
#undef FIX_USB1_EP6
#undef FIX_USB1_EP7
#undef FIX_USB2_EP1
#undef FIX_USB2_EP2
#undef FIX_USB2_EP3
#undef FIX_USB2_EP4
#undef FIX_USB2_EP6
#undef FIX_USB2_EP6
#undef FIX_USB2_EP7
```

3. Add the new susb1.s to the included assembly source files in the make file.

For example: ASM\_SRC := startup.s isrs.s susb1.s

4. Add usb\_init somewhere in the startup code. This will likely be in fwxmain.c as demonstrated below:

```
void fwx_program_init(void)
{
void usb_init(); /* define the prototype */
usb_init();
fwx_init(); /* Initialize everything in the base framework. */
}
```

5. Build the project using the modified make file.

### Fix Status

The ROM version of the BIOS will be updated during any future silicon rolls. No current roll of the part currently exists.

#### 10.Data Toggle Corruption Issue

#### Problem Definition

When a SIE is configured as a peripheral, data toggle corruption as specified in the USB 2.0 spec, section 8.6.4, does not work as specified.

#### Parameters Affected

SIEx Endpoint x Interrupt (Interrupt 32-47).

#### Trigger Conditions

This issue is seen when a SIE is configured as a peripheral and the host sends an incorrect data toggle. According to the USB specification, when an incorrect data toggle is seen from the host the peripheral should throw away the data but increment the data toggle bit to re-synchronize the data toggle bits. In the current ROM BIOS the SIEx Endpoint x Interrupt will ignore the data toggle error and accept the data.

#### ■ Scope of Impact

All peripheral functions are susceptible to this as it is a normal occurrence with USB traffic.

#### Workaround

To fix this problem the SIEx Endpoint x Interrupt must be replaced for any endpoint that is configured as an OUT endpoint.

- 1. Acquire the file called susb1.s from Cypress Support or by downloading a newer version of the frameworks that has this included.
- 2. Modify fwxcfg.h in your project to have the following flags and define/undef the fix for the endpoints you are using:

```
#define FIX_USB1_EP1
#define FIX_USB1_EP2
#undef FIX_USB1_EP3
#undef FIX_USB1_EP4
#undef FIX_USB1_EP5
#undef FIX_USB1_EP6
#undef FIX_USB1_EP7
#undef FIX_USB2_EP1
#undef FIX_USB2_EP2
#undef FIX_USB2_EP3
#undef FIX_USB2_EP4
#undef FIX_USB2_EP5
#undef FIX_USB2_EP6
#undef FIX_USB2_EP6
#undef FIX_USB2_EP7
```

- 3. Add the new susb1.s to the included assembly source files in the make file. For example: ASM\_SRC := startup.s isrs.s susb1.s
- 4. Add usb\_init somewhere in the startup code. This will likely be in *fwxmain.c* as demonstrated below:

```
void fwx_program_init(void)
{
void usb_init(); /* define the prototype */
usb_init();
fwx_init(); /* Initialize everything in the base framework. */
}
```

5. Build the project using the modified make file.

### Fix Status

The ROM version of the BIOS will be updated during any future silicon rolls. No current roll of the part currently exists.

# **Document History Page**

| Revision | ECN     | Orig. of<br>Change | Submission<br>Date | Description of Change  |
|----------|---------|--------------------|--------------------|--|
| **       | 111872  | MUL                | 03/22/02           | New Data Sheet   |
| *A       | 116988  | MUL                | 08/23/02           | Preliminary Data Sheet   |
| *В       | 124954  | MUL                | 04/10/03           | Added Memory Map Section and Ordering Information Section<br>Moved Functional Register Map Tables into Register section<br>General Clean-up<br>Changed from "Preliminary" to "Preliminary Confidential"  |
| *C       | 126211  | MUL                | 05/23/03           | Added Interface Description Section and Power Savings and Reset Section<br>Added Char Data<br>General Clean-up<br>Removed DRAM, MDMA, and EPP<br>Added "Programmable" to the title page  |
| *D       | 127334  | KKV                | 05/29/03           | Corrected font to enable correct symbol display  |
| *E       | 129394  | MUL                | 10/07/03           | Final Data Sheet<br>Changed Memory Map Section<br>Added USB OTG Logo<br>General Clean-up   |
| *F       | 472875  | ARI                | See ECN            | Removed "power consumption" bullet from the Features bullet list.<br>Corrected number GPIO[31:20] to read GPIO[31:30] in Section "Standalone<br>Mode".<br>Made sentence into a Note in Section "Reset Pin" and repeated the note in<br>Section "Host Port Interface (HPI)".<br>Corrected the Host/Device 1 Interrupt Enable (Bit 8) Information in Section<br>"Interrupt Enable Register [0xC00E] [R/W]".<br>Corrected data on Write Protect Enable (Bit 15) Section "GPIO Control Register<br>[0xC006] [R/W]" to read "the GPIO Mode Select [15:8] bits are read only unti<br>a chip reset".<br>Re-wrote the Register Description in Section "SIEXmsg Register [W]".<br>Put document on 2-column template and corrected grammar. Put the figure<br>captions at the top of the figures per new template specifications.<br>Added Static Discharge Voltage information in Section "Absolute Maximum<br>Ratings"<br>Added compliance statement and TID in Section "USB Transceiver". |
| *G       | 567317  | KKVTMP             | See ECN            | Added the lead free information on the Ordering Information Section. Implemented the new template with no numbers on the headings.   |
| *H       | 3378752 | NMMA               | 09/21/11           | Updated template and styles according to current Cypress standards.<br>Updated pin description in Ordering Information table.<br>Added Acronyms and Units of Measure.<br>Added Ordering Code Definitions.  |
| *        | 3997630 | PRJI               | 05/11/2013         | Added Appendix: Silicon Errata for the EZ-OTG™ Programmable USB<br>On-The-Go Host/Peripheral Controller, CY7C67200 Product Family.   |

# Sales, Solutions, and Legal Information

## Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at Cypress Locations.
