

DLPC3432 Display Controller

1 Features

- DLP230GP (.23 qHD) DMD Display Controller
 - Supports Input Resolutions Up to 720p
 - Low-Power DMD Interface With Interface Training
- Input Frame Rates Up to 120 Hz
- 24-Bit, Input Pixel Interface Including:
 - Parallel or BT656, Interface Protocols
 - Pixel Clock Up to 150 MHz
 - Multiple Input Pixel Data Format Options
- Pixel Data Processing Including:
 - IntelliBright™ Suite of Image Processing Algorithms
 - Content Adaptive Illumination Control
 - Local Area Brightness Boost
 - 1-D Keystone Correction
 - Color Coordinate Adjustment
 - Active Power Management Processing
- External Flash Support
- Embedded Frame Memory (eDRAM)
- System Features Including:
 - I²C Control of Device Configuration
 - Programmable LED Current Control
 - One Frame Latency

2 Applications

- Smart Phone, Tablet, Laptop
- Battery-Powered Mobile Accessory
- Wearable (Near-Eye) Display
- Smart Home Display
- Smart Speaker

3 Description

The DLPC3432 digital controller, part of the DLP230GP (.23 qHD) chipset, supports reliable operation of the DLP230GP digital micromirror device (DMD). The DLPC3432 controller provides a convenient, multi-functional interface between user electronics and the DMD, enabling small form factor and low power display applications.

Visit the [getting started with TI DLP®Pico™ display technology](#) page to learn how to get started with the DLP230GP chipset.

The DLP230GP chipset includes established resources to help the user accelerate the design cycle, which include [production ready optical modules](#), [optical modules manufactures](#), and [design houses](#).

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DLPC3432	NFBGA (176)	7.00 mm x 7.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Simplified Schematic

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (March 2018) to Revision B	Page
• Product status changed to Production Data	1
• Updated Features section to include supported input resolution of up to 720p	1
• Added missing cross reference to <i>3D Glasses Operation</i> in <i>Input Source - Frame Rates and 3D Display Orientation</i>	27
• Clarified DDxN and DDxP pair length guidelines in <i>PCB Layout Guidelines for DSI Interface</i>	51

Changes from Original (February 2018) to Revision A	Page
• Updated Simplified Schematic and <i>Typical Application</i> images - "DLP343x" is changed to "DLPC3432", "qHD DMD" is changed to "0.23 qHD DMD"	1
• Added DSI pin functions in Pin Functions - DSI Input Data and Clock	7
• Added <i>DSI Host Timing Requirements</i>	24
• Added <i>Input Source - Frame Rates and 3D Display Orientation</i>	27
• Added <i>DSI Interface - Supported Data Transfer Formats</i>	29
• Added <i>Display Serial Interface DSI</i>	31
• Added <i>3D Glasses Operation</i>	38
• Added <i>PCB Layout Guidelines for DSI Interface</i>	51
• In <i>Device Markings</i> , definition of 'x' in 'DLPC343x' is redefined as 2 instead of 0 or 5	55

Pin Functions – Board Level Test, Debug, and Initialization

PIN		I/O	DESCRIPTION
NAME	NUMBER		
HWTEST_EN	C10	I ₆	Manufacturing test enable signal. This signal should be connected directly to ground on the PCB for normal operation.
PARKZ	C13	I ₆	DMD fast PARK control (active low input, hysteresis buffer). PARKZ must be set high to enable normal operation. PARKZ should be set high prior to releasing RESETZ (that is, prior to the low-to-high transition on the RESETZ input). PARKZ should be set low for a minimum of 32 μs before any power is removed from the DLPC3432 such that the fast DMD PARK operation can be completed. Note for PARKZ, fast PARK control should only be used when loss of power is about to happen and beyond the control of the host processor (for example, when the external power source has been disconnected or the battery has dropped below a minimum level). The longest lifetime of the DMD is not achieved with the fast PARK operation, but rather with a normal PARK operation. Because of this, PARKZ is typically used in conjunction with a normal PARK request control input through GPIO_08. The difference being that when the host sets PROJ_ON low, which connects to both GPIO_08 and the DLPA2000 PMIC chip, the DLPC3432 takes much longer than 32 μs to park the mirrors. The DLPA2000 holds on all power supplies and keeps RESETZ high until the longer mirror parking has completed. This longer mirror parking time, of up to 500 μs, ensures the longest DMD lifetime and reliability. The DLPA2000 monitors power to the DLPC3432 and detects any imminent power loss condition and drives the PARKZ signal accordingly.
Reserved	P12	I ₆	TI internal use. Should be left unconnected.
Reserved	P13	I ₆	TI internal use. Should be left unconnected.
Reserved	N13 ⁽¹⁾	O ₁	TI internal use. Should be left unconnected.
Reserved	N12 ⁽¹⁾	O ₁	TI internal use. Should be left unconnected.
Reserved	M13	I ₆	TI internal use. Should be left unconnected.
Reserved	N11	I ₆	TI internal use. Should be left unconnected.
Reserved	P11	I ₆	TI internal use. This pin must be tied to ground, through an external resistor of up to 8 kΩ for normal operation. Failure to tie this pin low during normal operation will cause start-up and initialization problems.
RESETZ	C11	I ₆	DLPC3432 power-on reset (active low input, hysteresis buffer). Self-configuration starts when a low-to-high transition is detected on RESETZ. All ASIC power and clocks must be stable before this reset is de-asserted. Note that the following signals will be tri-stated while RESETZ is asserted: SPI0_CLK, SPI0_DOUT, SPI0_CSZ0, SPI0_CSZ1, and GPIO(19:00) External pullups or downs (as appropriate) should be added to all tri-stated output signals listed (including bidirectional signals to be configured as outputs) to avoid floating ASIC outputs during reset if connected to devices on the PCB that can malfunction. For SPI, at a minimum, any chip selects connected to the devices should have a pullup. Unused bidirectional signals can be functionally configured as outputs to avoid floating ASIC inputs after RESETZ is set high. The following signals are forced to a logic low state while RESETZ is asserted and corresponding I/O power is applied: LED_SEL_0, LED_SEL_1 and DMD_DEN_ARSTZ No signals will be in their active state while RESETZ is asserted. Note that no I ² C activity is permitted for a minimum of 500 ms after RESETZ (and PARKZ) are set high.
TSTPT_0	R12	B ₁	Test pin 0 (includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ, and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use. Note: An external pullup should not be applied to this pin to avoid putting the DLPC3432 in a test mode. Without external pullup ⁽²⁾ Feeds TMSEL(0) With external pullup ⁽³⁾ Feeds TMSEL(0)

- (1) If operation does not call for an external pullup and there is no external logic that might overcome the weak internal pulldown resistor, then this I/O can be left open or unconnected for normal operation. If operation does not call for an external pullup, but there is external logic that might overcome the weak internal pulldown resistor, then an external pulldown resistor is recommended to ensure a logic low.
- (2) External pullup resistor must be 8 kΩ, or less, for pins with internal pullup or down resistors.
- (3) If operation does not call for an external pullup and there is no external logic that might overcome the weak internal pulldown resistor, then the TSTPT I/O can be left open/ unconnected for normal operation. If operation does not call for an external pullup, but there is external logic that might overcome the weak internal pulldown resistor, then an external pulldown resistor is recommended to ensure a logic low.

Pin Functions – Board Level Test, Debug, and Initialization (continued)

PIN		I/O	DESCRIPTION
NAME	NUMBER		
TSTPT_1	R13	B ₁	<p>Test pin 1 (includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use. Note: An external pullup should not be applied to this pin to avoid putting the DLPC3432 in a test mode.</p> <p>Without external pullup⁽²⁾ Feeds TMSEL(1)</p> <p>With external pullup⁽³⁾ Feeds TMSEL(1)</p>
TSTPT_2	R14	B ₁	<p>Test pin 2 (includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use. Note: An external pullup should not be applied to this pin to avoid putting the DLPC3432 in a test mode.</p> <p>Without external pullup⁽²⁾ Feeds TMSEL(2)</p> <p>With external pullup⁽³⁾ Feeds TMSEL(2)</p>
TSTPT_3	R15	B ₁	<p>Test pin 3 (Includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use.</p>
TSTPT_4	P14	B ₁	<p>Test pin 4 (Includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use.</p>
TSTPT_5	P15	B ₁	<p>Test pin 5 (Includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use.</p>
TSTPT_6	N14	B ₁	<p>Test pin 6 (Includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use. Alternative use: none. External logic shall not unintentionally pull this pin high to avoid putting the DLPC3432 in a test mode.</p>
TSTPT_7	N15	B ₁	<p>Test pin 7 (Includes weak internal pulldown) – tri-stated while RESETZ is asserted low. Sampled as an input test mode selection control approximately 1.5 μs after de-assertion of RESETZ and then driven as an output. Normal use: Reserved for test output. Should be left open for normal use.</p>

Pin Functions – Parallel Port Input Data and Control⁽¹⁾⁽²⁾

PIN		I/O	DESCRIPTION	
NAME	NUMBER		PARALLEL RGB MODE	BT656 INTERFACE MODE
PCLK	P3	I ₁₁	Pixel clock ⁽³⁾	Pixel clock ⁽³⁾

PDATA_16	R6	I ₁₁	(TYPICAL RGB 888) Red (bit weight 1)	Unused
PDATA_17	P7		Red (bit weight 2)	
PDATA_18	R7		Red (bit weight 4)	
PDATA_19	P8		Red (bit weight 8)	
PDATA_20	R8		Red (bit weight 16)	
PDATA_21	P9		Red (bit weight 32)	
PDATA_22	R9		Red (bit weight 64)	
PDATA_23	P10		Red (bit weight 128)	

(1) PDATA(23:0) bus mapping is pixel format and source mode dependent. See later sections for details.

(2) PDM_CVS_TE is optional for parallel interface operation. If unused, inputs should be grounded or pulled down to ground through an external resistor (8 kΩ or less).

(3) Pixel clock capture edge is software programmable.

(4) The parallel data mask signal input is optional for parallel interface operations. If unused, inputs should be grounded or pulled down to ground through an external resistor (8 kΩ or less).

(5) Unused inputs should be grounded or pulled down to ground through an external resistor (8 kΩ or less).

(6) VSYNC, HSYNC, and DATAEN polarity is software programmable.

Pin Functions - DSI Input Data and Clock

Added PIN		I/O	DESCRIPTION
NAME	NUMBER		MIPI DSI MODE
DCLKN DCLKP	E2 E1	B ₁₀	DSI interface; DSI - LVDS differential clock
DD0N DD0P DD1N DD1P DD2N DD2P DD3N DD3P	G2 G1 F2 F1 D2 D1 C2 C1	B ₁₀	DSI interface, DSI data lane LVDS differential pair inputs 0 to 3 (Support a maximum of 4 input DSI lanes) ⁽¹⁾
RREF	F3		DSI reference resistor: A 30 kΩ ± 1% external trim resistor should be connected from this pin to ground ⁽²⁾

- (1) For DSI, differential data bus(0) is required for DSI operation with the remaining 3 data lanes being optional or implementation specific as needed. Any unused DSI LVDS pairs should be unconnected and left floating.
- (2) R_{REF} is an analog signal that requires a fixed precision resistor connected to this pin when DSI is utilized. If DSI is NOT utilized then this signal should be unconnected and left floating on the board design.

Pin Functions – DMD Reset and Bias Control

PIN		I/O	DESCRIPTION
NAME	NUMBER		
DMD_DEN_ARSTZ	B1	O ₂	DMD driver enable (active high) or DMD reset (active low). Assuming the corresponding I/O power is supplied, this signal will be driven low after the DMD is parked and before power is removed from the DMD. If the 1.8-V power to the DLPC3432 is independent of the 1.8-V power to the DMD, then TI recommends a weak, external pulldown resistor to hold the signal low in the event the DLPC3432 power is inactive while DMD power is applied.
DMD_LS_CLK	A1	O ₃	DMD, low speed interface clock
DMD_LS_WDATA	A2	O ₃	DMD, low speed serial write data
DMD_LS_RDATA	B2	I ₆	DMD, low speed serial read data

Pin Functions – DMD Sub-LVDS Interface

PIN		I/O	DESCRIPTION
NAME	NUMBER		
DMD_HS_CLK_P DMD_HS_CLK_N	A7 B7	O ₄	DMD high speed interface
DMD_HS_WDATA_H_P DMD_HS_WDATA_H_N DMD_HS_WDATA_G_P DMD_HS_WDATA_G_N DMD_HS_WDATA_F_P DMD_HS_WDATA_F_N DMD_HS_WDATA_E_P DMD_HS_WDATA_E_N DMD_HS_WDATA_D_P DMD_HS_WDATA_D_N DMD_HS_WDATA_C_P DMD_HS_WDATA_C_N DMD_HS_WDATA_B_P DMD_HS_WDATA_B_N DMD_HS_WDATA_A_P DMD_HS_WDATA_A_N	A3 B3 A4 B4 A5 B5 A6 B6 A8 B8 A9 B9 A10 B10 A11 B11	O ₄	DMD high speed interface lanes, write data bits: The true numbering and application of the DMD_HS_DATA pins are software configuration dependent

Pin Functions – Peripheral Interface⁽¹⁾

PIN		I/O	DESCRIPTION
NAME	NUMBER		
CMP_OUT	A12	I ₆	Successive approximation ADC comparator output (DLPC3432 input). Assumes a successive approximation ADC is implemented with a WPC light sensor possibly with a thermistor feeding one input of an external comparator and the other side of the comparator is driven from the ASIC's CMP_PWM pin. Should be pulled-down to ground if this function is not used (hysteresis buffer).
CMP_PWM	A15	O ₁	Successive approximation comparator pulse-duration modulation (output). Supplies a PWM signal to drive the successive approximation ADC comparator used in WPC light-to-voltage sensor applications. Should be left unconnected if this function is not used.
HOST_IRQ ⁽²⁾	N8	O ₉	Host interrupt (output) HOST_IRQ indicates when the DLPC3432 auto-initialization is in progress and most importantly when it completes. The DLPC3432 tri-states this output during reset and assumes that an external pullup is in place to drive this signal to its inactive state.
IIC0_SCL	N10	B ₇	I ² C slave (port 0) SCL (bidirectional, open-drain signal with input hysteresis): An external pullup is required. The slave I ² C I/Os are 3.6-V tolerant (high-volt-input tolerant) and are powered by V _{CC_INTF} (which can be 1.8, 2.5, or 3.3 V). External I ² C pullups must be connected to a host supply with an equal or higher supply voltage, up to a maximum of 3.6 V (a lower pullup supply voltage would not likely satisfy the V _{IH} specification of the slave I ² C input buffers).
Reserved	R11	B ₈	TI internal use. TI recommends an external pullup resistor.
IIC0_SDA	N9	B ₇	I ² C slave (port 0) SDA. (bidirectional, open-drain signal with input hysteresis): An external pullup is required. The slave I ² C port is the control port of ASIC. The slave I ² C I/Os are 3.6-V tolerant (high-volt-input tolerant) and are powered by V _{CC_INTF} (which can be 1.8, 2.5, or 3.3 V). External I ² C pullups must be connected to a host supply with an equal or higher supply voltage, up to a maximum of 3.6 V (a lower pullup supply voltage would not likely satisfy the V _{IH} specification of the slave I ² C input buffers).
Reserved	R10	B ₈	TI internal use. TI recommends an external pullup resistor.
LED_SEL_0	B15	O ₁	LED enable select. Controlled by programmable DMD sequence Timing Enabled LED LED_SEL(1:0) DLPA2000 application 00 None 01 Red 10 Green 11 Blue
LED_SEL_1	B14	O ₁	These signals will be driven low when RESETZ is asserted and the corresponding I/O power is supplied. They will continue to be driven low throughout the auto-initialization process. A weak, external pulldown resistor is still recommended to ensure that the LEDs are disabled when I/O power is not applied.
SPI0_CLK	A13	O ₁₃	Synchronous serial port 0, clock
SPI0_CSZ0	A14	O ₁₃	SPI port 1, chip select 0 (active low output) TI recommends an external pullup resistor to avoid floating inputs to the external SPI device during ASIC reset assertion.
SPI0_CSZ1	C12	O ₁₃	SPI port 1, chip select 1 (active low output) TI recommends an external pullup resistor to avoid floating inputs to the external SPI device during ASIC reset assertion.
SPI0_DIN	B12	I ₁₂	Synchronous serial port 0, receive data in
SPI0_DOUT	B13	O ₁₃	Synchronous serial port 0, transmit data out

(1) External pullup resistor must be 8 kΩ or less.

(2) For more information about usage, see [HOST_IRQ Usage Model](#).

Pin Functions – GPIO Peripheral Interface⁽¹⁾

PIN		I/O	DESCRIPTION ⁽²⁾
NAME	NUMBER		
GPIO_19	M15	B ₁	General purpose I/O 19 (hysteresis buffer). Options: <ol style="list-style-type: none"> Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input). MTR_SENSE, motor sense (Input): For focus motor control applications, this GPIO must be configured as an input to the DLPC3432 fed from the focus motor position sensor. KEYPAD_4 (input): Keypad applications
GPIO_18	M14	B ₁	General purpose I/O 18 (hysteresis buffer). Options: <ol style="list-style-type: none"> Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input). KEYPAD_3 (input): Keypad applications

GPIO_13	J15	B ₁	General purpose I/O 13 (hysteresis buffer). Options: <ol style="list-style-type: none"> CAL_PWR (output): Intended to feed the calibration control of the successive approximation ADC light sensor. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_12	J14	B ₁	General purpose I/O 12 (hysteresis buffer). Options: <ol style="list-style-type: none"> (Output) power enable control for LABB light sensor. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_11	H15	B ₁	General purpose I/O 11 (hysteresis buffer). Options: <ol style="list-style-type: none"> (Output): Thermistor power enable. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_10	H14	B ₁	General Purpose I/O 10 (hysteresis buffer). Options: <ol style="list-style-type: none"> RC_CHARGE (output): Intended to feed the RC charge circuit of the successive approximation ADC used to control the light sensor comparator. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_09	G15	B ₁	General purpose I/O 09 (hysteresis buffer). Options: <ol style="list-style-type: none"> LS_PWR (active high output): Intended to feed the power control signal of the successive approximation ADC light sensor. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).

(1) GPIO signals must be configured through software for input, output, bidirectional, or open-drain. Some GPIO have one or more alternative use modes, which are also software configurable. The reset default for all GPIO is as an input signal. An external pullup is required for each signal configured as open-drain.

(2) DLPC3432 general purpose I/O. These GPIO are software configurable.

Pin Functions – GPIO Peripheral Interface⁽¹⁾ (continued)

PIN		I/O	DESCRIPTION ⁽²⁾
NAME	NUMBER		
GPIO_08	G14	B ₁	General purpose I/O 08 (hysteresis buffer). Options: 1. (All) Normal mirror parking request (active low): To be driven by the PROJ_ON output of the host. A logic low on this signal will cause the DLPC3432 to PARK the DMD, but it will not power down the DMD (the DLPA2000 does that instead). The minimum high time is 200 ms. The minimum low time is also 200 ms.
GPIO_07	F15	B ₁	General purpose I/O 07 (hysteresis buffer). Options: 1. (Output): LABB output sample and hold sensor control signal. 2. (All) GPIO (bidirectional): Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_06	F14	B ₁	General purpose I/O 06 (hysteresis buffer). Option: 1. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used. An external pulldown resistor is required to deactivate this signal during reset and auto-initialization processes.
GPIO_05	E15	B ₁	General purpose I/O 05 (hysteresis buffer). Options: 1. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_04	E14	B ₁	General purpose I/O 04 (hysteresis buffer). Options: 1. SPI1_CSZ1 (active-low output): optional SPI1 chip select 1 signal. An external pullup resistor is required to deactivate this signal during reset and auto-initialization processes. 2. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_03	D15	B ₁	General purpose I/O 03 (hysteresis buffer). Options: 1. SPI1_CSZ0 (active low output): Optional SPI1 chip select 0 signal. An external pullup resistor is required to deactivate this signal during reset and auto-initialization processes. 2. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).

Pin Functions – GPIO Peripheral Interface⁽¹⁾ (continued)

PIN		I/O	DESCRIPTION ⁽²⁾
NAME	NUMBER		
GPIO_02	D14	B ₁	General purpose I/O 02 (hysteresis buffer). Options: <ol style="list-style-type: none"> SPI1_DOUT (output): Optional SPI1 data output signal. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_01	C15	B ₁	General purpose I/O 01 (hysteresis buffer). Options: <ol style="list-style-type: none"> SPI1_CLK (output): Optional SPI1 clock signal. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).
GPIO_00	C14	B ₁	General purpose I/O 00 (hysteresis buffer). Options: <ol style="list-style-type: none"> SPI1_DIN (input): Optional SPI1 data input signal. Optional GPIO. Should be configured as a logic zero GPIO output and left unconnected if not used (otherwise it will require an external pullup or pulldown to avoid a floating GPIO input).

Pin Functions – Clock and PLL Support

PIN		I/O	DESCRIPTION
NAME	NUMBER		
PLL_REFCLK_I	H1	I ₁₁	Reference clock crystal input. If an external oscillator is used in place of a crystal, then this pin should be used as the oscillator input.
PLL_REFCLK_O	J1	O ₅	Reference clock crystal return. If an external oscillator is used in place of a crystal, then this pin should be left unconnected (that is floating with no added capacitive load).

Pin Functions – Power and Ground

PIN		I/O	DESCRIPTION
NAME	NUMBER		
V _{DD}	C5, D5, D7, D12, J4, J12, K3, L4, L12, M6, M9, D9, D13, F13, H13, L13, M10, D3, E3	PWR	Core power 1.1 V (main 1.1 V)
V _{SS}	Common to all package types C4, D6, D8, D10, E4, E13, F4, G4, G12, H4, H12, J3, J13, K4, K12, L3, M4, M5, M8, M12, G13, C6, C8 Only available on DLPC3432 F6, F7, F8, F9, F10, G6, G7, G8, G9, G10, H6, H7, H8, H9, H10, J6, J7, J8, J9, J10, K6, K7, K8, K9, K10	GND	Core ground (eDRAM, I/O ground, thermal ground)
V _{CC18}	C7, C9, D4, E12, F12, K13, M11	PWR	All 1.8-V I/O power: (1.8-V power supply for all I/O other than the host or parallel interface and the SPI flash interface. This includes RESETZ, PARKZ LED_SEL, CMP, GPIO, IIC1, TSTPT, and JTAG pins)
V _{CC_INTF}	M3, M7, N3, N7	PWR	Host or parallel interface I/O power: 1.8 to 3.3 V (Includes IIC0, PDATA, video syncs, and HOST_IRQ pins)
V _{CC_FLSH}	D11	PWR	Flash interface I/O power: 1.8 to 3.3 V (Dedicated SPI0 power pin)
V _{DD_PLLM}	H2	PWR	MCG PLL 1.1-V power
V _{SS_PLLM}	G3	RTN	MCG PLL return
V _{DD_PLLD}	J2	PWR	DCG PLL 1.1-V power
V _{SS_PLLD}	H3	RTN	DCG PLL return

Table 1. I/O Type Subscript Definition

I/O		SUPPLY REFERENCE	ESD STRUCTURE
SUBSCRIPT	DESCRIPTION		
1	1.8-V LVCMOS I/O buffer with 8-mA drive	V_{cc18}	ESD diode to GND and supply rail
2	1.8-V LVCMOS I/O buffer with 4-mA drive	V_{cc18}	ESD diode to GND and supply rail
3	1.8-V LVCMOS I/O buffer with 24-mA drive	V_{cc18}	ESD diode to GND and supply rail
4	1.8-V sub-LVDS output with 4-mA drive	V_{cc18}	ESD diode to GND and supply rail
5	1.8, 2.5, 3.3 LVCMOS with 4-mA drive	V_{cc_INTF}	ESD diode to GND and supply rail
6	1.8-V LVCMOS input	V_{cc18}	ESD diode to GND and supply rail
7	1.8-, 2.5-, 3.3-V I ² C with 3-mA drive	V_{cc_INTF}	ESD diode to GND and supply rail
8	1.8-V I ² C with 3-mA drive	V_{cc18}	ESD diode to GND and supply rail
9	1.8-, 2.5-, 3.3-V LVCMOS with 8-mA drive	V_{cc_INTF}	ESD diode to GND and supply rail
11	1.8, 2.5, 3.3 LVCMOS input	V_{cc_INTF}	ESD diode to GND and supply rail
12	1.8-, 2.5-, 3.3-V LVCMOS input	V_{cc_FLSH}	ESD diode to GND and supply rail
13	1.8-, 2.5-, 3.3-V LVCMOS with 8-mA drive	V_{cc_FLSH}	ESD diode to GND and supply rail

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
SUPPLY VOLTAGE⁽²⁾⁽³⁾				
$V_{(VDD)}$ (core)		-0.3	1.21	V
$V_{(VDDL12)}$ (core)		-0.3	1.32	V
Power + sub-LVDS		-0.3	1.96	V
$V_{(VCC_INTF)}$	Host I/O power	-0.3	3.60	V
	If 1.8-V power used	-0.3	1.99	
	If 2.5-V power used	-0.3	2.75	
	If 3.3-V power used	-0.3	3.60	
$V_{(VCC_FLSH)}$	Flash I/O power	-0.3	3.60	V
	If 1.8-V power used	-0.3	1.96	
	If 2.5-V power used	-0.3	2.72	
	If 3.3-V power used	-0.3	3.58	
$V_{(VDD_PLL1)}$ (MCG PLL)		-0.3	1.21	V
$V_{(VDD_PLL2)}$ (1DCG PLL)		-0.3	1.21	V
GENERAL				
T_J	Operating junction temperature	-30	125	°C
T_{stg}	Storage temperature	-40	125	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values are with respect to GND.
- Overlap currents, if allowed to continue flowing unchecked, not only increase total power dissipation in a circuit, but degrade the circuit reliability, thus shortening its usual operating life.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V _(VDD)	Core power 1.1 V (main 1.1 V)	±5% tolerance	1.045	1.1	1.155	V
V _(VCC18)	All 1.8-V I/O power: (1.8-V power supply for all I/O other than the host or parallel interface and the SPI flash interface. This includes RESETZ, PARKZ LED_SEL, CMP, GPIO, IIC1, TSTPT, and JTAG pins.)	±8.5% tolerance	1.64	1.8	1.96	V
V _(VCC_INTF)	Host or parallel interface I/O power: 1.8 to 3.3 V (includes IIC0, PDATA, video syncs, and HOST_IRQ pins)	±8.5% tolerance See ⁽¹⁾	1.64	1.8	1.96	V
			2.28	2.5	2.72	
			3.02	3.3	3.58	
V _(VCC_FLSH)	Flash interface I/O power: 1.8 to 3.3 V	±8.5% tolerance See ⁽¹⁾	1.64	1.8	1.96	V
			2.28	2.5	2.72	
			3.02	3.3	3.58	
V _(VDD_PLLM)	MCG PLL 1.1-V power	±9.1% tolerance See ⁽²⁾	1.025	1.1	1.155	V
V _(VDD_PLLD)	DCG PLL 1.1-V power	±9.1% tolerance See ⁽²⁾	1.025	1.1	1.155	V
T _A	Operating ambient temperature ⁽³⁾		–30		85	°C
T _J	Operating junction temperature		–30		105	°C

(1) These supplies have multiple valid ranges.

(2) These I/O supply ranges are wider to facilitate additional filtering.

(3) The operating ambient temperature range assumes 0 forced air flow, a JEDEC JESD51 junction-to-ambient thermal resistance value at 0 forced air flow (R_{θJA} at 0 m/s), a JEDEC JESD51 standard test card and environment, along with minimum and max estimated power dissipation across process, voltage, and temperature. Thermal conditions vary by application, which will impact R_{θJA}. Thus, maximum operating ambient temperature varies by application.

$$(a) T_{a_min} = T_{j_min} - (P_{d_min} \times R_{\theta JA}) = -30^{\circ}\text{C} - (0.0 \text{ W} \times 30.3^{\circ}\text{C/W}) = -30^{\circ}\text{C}$$

$$(b) T_{a_max} = T_{j_max} - (P_{d_max} \times R_{\theta JA}) = 105^{\circ}\text{C} - (0.348 \text{ W} \times 30.3^{\circ}\text{C/W}) = 94.4^{\circ}\text{C}$$

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DLPC3432	UNIT
		ZVB (NFBGA)	
		176 PINS	
R _{θJC}	Junction-to-case thermal resistance	11.2	°C/W
R _{θJA}	Junction-to-air thermal resistance	at 0 m/s of forced airflow ⁽²⁾	30.3
		at 1 m/s of forced airflow ⁽²⁾	27.4
		at 2 m/s of forced airflow ⁽²⁾	26.6
ψ _{JT}	Temperature variance from junction to package top center temperature, per unit power dissipation ⁽³⁾	.27	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

(2) Thermal coefficients abide by JEDEC Standard 51. R_{θJA} is the thermal resistance of the package as measured using a JEDEC defined standard test PCB. This JEDEC test PCB is not necessarily representative of the DLPC3432 PCB and thus the reported thermal resistance may not be accurate in the actual product application. Although the actual thermal resistance may be different, it is the best information available during the design phase to estimate thermal performance.

(3) Example: (0.5 W) × (0.2°C/W) ≈ 1.00°C temperature rise.

6.5 Electrical Characteristics Over Recommended Operating Conditions

see (1)(2)(3)(4)(5)(6)(7)

PARAMETER		TEST CONDITIONS ⁽⁸⁾	MIN	TYP ⁽⁶⁾⁽⁷⁾	MAX ⁽⁹⁾⁽⁷⁾	UNIT
$V_{(VDD)} + V_{(VDDL12)}$	Core current 1.1 V (main 1.1 V)	IDLE disabled, WVGA, 60 Hz		112	232.2	mA
		IDLE enabled, WVGA, 60 Hz		85		
		IDLE disabled, WVGA, 120 Hz			252.9	
$V_{(VDD_PLLM)}$	MCG PLL 1.1-V current	IDLE disabled, WVGA, 60 Hz		112	6	mA
		IDLE enabled, WVGA, 60 Hz		85		
		IDLE disabled, WVGA, 120 Hz			6	
$V_{(VDD_PLLD)}$	DCG PLL 1.1-V current	IDLE disabled, WVGA, 60 Hz		112	6	mA
		IDLE enabled, WVGA, 60 Hz		85		
		IDLE disabled, WVGA, 120 Hz			6	
$V_{(VCC18)}$	All 1.8-V I/O current: (1.8-V power supply for all I/O other than the host or parallel interface and the SPI flash interface. This includes sub-LVDS DMD I/O, RESETZ, PARKZ LED_SEL, CMP, GPIO, IIC1, TSTPT, and JTAG pins)	IDLE disabled, WVGA, 60 Hz		13		mA
		IDLE enabled, WVGA, 60 Hz		13		
		IDLE disabled, WVGA, 120 Hz			12.62	
$V_{(VCC_INTF)}$	Host or parallel interface I/O current: 1.8 to 3.3 V (includes IIC0, PDATA, video syncs, and HOST_IRQ pins)	IDLE disabled, WVGA, 60 Hz			1.5	mA
		IDLE disabled, WVGA, 120 Hz			1.5	
$V_{(VCC_FLSH)}$	Flash interface I/O current: 1.8 to 3.3 V	IDLE disabled, WVGA, 60 Hz			1.01	mA
		IDLE disabled, WVGA, 120 Hz			1.01	

- (1) Assumes 12.5% activity factor, 30% clock gating on appropriate domains, and mixed SVT or HVT cells.
- (2) Programmable host and flash I/O are at minimum voltage (that is 1.8 V) for this typical scenario.
- (3) Maximum currents column use typical motion video as the input. The typical currents column uses SMPTE color bars as the input.
- (4) Some applications may be forced to use 1-oz copper to manage ASIC package heat.
- (5) For the typical cases, all pins using 1.8 V are tied together as are 1.1-V pins, and the current specified is for the collective 1.8-V and 1.1-V current.
- (6) Assumes typical case power PVT condition = nominal process, typical voltage, typical temperature (55°C junction). WVGA resolution.
- (7) Input image is 854 × 480 (WVGA) 24-bits on the parallel interface at the frame rate shown with 0.2-inch WVGA DMD.
- (8) In normal mode.
- (9) Assumes worst case power PVT condition = corner process, high voltage, high temperature (105°C junction), WVGA resolution.

6.6 Electrical Characteristics⁽¹⁾⁽²⁾

over operating free-air temperature range (unless otherwise noted)

PARAMETER ⁽³⁾		TEST CONDITIONS	MIN	TYP	MAX	UNIT		
V _{IH}	High-level input threshold voltage	I ² C buffer (I/O type 7)			0.7 × V _{CC_INTF} ⁽¹⁾	V		
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)			1.17		3.6	
		1.8-V LVTTTL (I/O type 1, 6) identified in ⁽²⁾ CMP_OUT; PARKZ; RESETZ; GPIO 0 →19			1.3		3.6	
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)			1.7		3.6	
		3.3-V LVTTTL (I/O type 5, 9, 11, 12, 13)			2		3.6	
V _{IL}	Low-level input threshold voltage	I ² C buffer (I/O type 7)			−0.5	0.3 × V _{CC_INTF}	V	
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)			−0.3	0.63		
		1.8-V LVTTTL (I/O type 1, 6) identified in ⁽²⁾ CMP_OUT; PARKZ; RESETZ; GPIO_00 through GPIO_19			−0.3	0.5		
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)			−0.3	0.7		
		3.3-V LVTTTL (I/O type 5, 9, 11, 12, 13)			−0.3	0.8		
V _{CM}	Steady-state common mode voltage	1.8 sub-LVDS (DMD high speed) (I/O type 4)		0.8	0.9	1	mV	
V _{ODI}	Differential output magnitude	1.8 sub-LVDS (DMD high speed) (I/O type 4)			200		mV	
V _{OH}	High-level output voltage	1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)			1.35		V	
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)			1.7			
		3.3-V LVTTTL (I/O type 5, 9, 11, 12, 13)			2.4			
		1.8 sub-LVDS – DMD high speed (I/O type 4)				1		
V _{OL}	Low-level output voltage	I ² C buffer (I/O type 7)	V _{CC_INTF} > 2 V			0.4	V	
		I ² C buffer (I/O type 7)	V _{CC_INTF} < 2 V			0.2 × V _{CC_INTF}		
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)						0.45
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)						0.7
		3.3-V LVTTTL (I/O type 5, 9, 11, 12, 13)						0.4
		1.8 sub-LVDS – DMD high speed (I/O type 4)				0.8		

(1) I/O is high voltage tolerant; that is, if V_{CC} = 1.8 V, the input is 3.3-V tolerant, and if V_{CC} = 3.3 V, the input is 5-V tolerant.

(2) ASIC pins: CMP_OUT; PARKZ; RESETZ; GPIO_00 through GPIO_19 have slightly varied V_{IH} and V_{IL} range from other 1.8-V I/O.

(3) The number inside each parenthesis for the I/O refers to the type defined in Table 1.

Electrical Characteristics⁽¹⁾⁽²⁾ (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER ⁽³⁾		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{OH}	High-level output current	1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)	4 mA	2		mA
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)	8 mA	3.5		
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)	24 mA	10.6		
		2.5-V LVTTTL (I/O type 5)	4 mA	5.4		
		2.5-V LVTTTL (I/O type 9, 13)	8 mA	10.8		
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)	24 mA	28.7		
		3.3-V LVTTTL (I/O type 5)	4 mA	7.8		
		3.3-V LVTTTL (I/O type 9, 13)	8 mA	15		
I_{OL}	Low-level output current	I ² C buffer (I/O type 7)		3		mA
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)	4 mA	2.3		
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)	8 mA	4.6		
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)	24 mA	13.9		
		2.5-V LVTTTL (I/O type 5)	4 mA	5.2		
		2.5-V LVTTTL (I/O type 9, 13)	8 mA	10.4		
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)	24 mA	31.1		
		3.3-V LVTTTL (I/O type 5)	4 mA	4.4		
		3.3-V LVTTTL (I/O type 9, 13)	8 mA	8.9		
I_{OZ}	High-impedance leakage current	I ² C buffer (I/O type 7)	$0.1 \times V_{CC_INTF} < V_I$ $< 0.9 \times V_{CC_INTF}$	-10	10	μ A
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)		-10	10	
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)		-10	10	
		3.3-V LVTTTL (I/O type 5, 9, 11, 12, 13)		-10	10	
C_I	Input capacitance (including package)	I ² C buffer (I/O type 7)			5	pF
		1.8-V LVTTTL (I/O type 1, 2, 3, 5, 6, 8, 9, 11, 12, 13)		2.6	3.5	
		2.5-V LVTTTL (I/O type 5, 9, 11, 12, 13)		2.6	3.5	
		3.3-V LVTTTL (I/O type 5, 9, 11, 12, 13)		2.6	3.5	
		1.8 sub-LVDS – DMD high speed (I/O type 4)			3	

6.7 Internal Pullup and Pulldown Characteristics

 see ⁽¹⁾⁽²⁾

INTERNAL PULLUP AND PULLDOWN RESISTOR CHARACTERISTICS	V _{CCIO}	MIN	MAX	UNIT
Weak pullup resistance	3.3 V	29	63	kΩ
	2.5 V	38	90	kΩ
	1.8 V	56	148	kΩ
Weak pulldown resistance	3.3 V	30	72	kΩ
	2.5 V	36	101	kΩ
	1.8 V	52	167	kΩ

(1) The resistance is dependent on the supply voltage level applied to the I/O.

(2) An external 8-kΩ pullup or pulldown (if needed) would work for any voltage condition to correctly pull enough to override any associated internal pullups or pulldowns.

6.8 High-Speed Sub-LVDS Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	NOM	MAX	UNIT
V _{CM}	Steady-state common mode voltage	0.8	0.9	1.0	V
V _{CM} (Δ _{pp}) ⁽¹⁾	V _{CM} change peak-to-peak (during switching)			75	mV
V _{CM} (Δ _{ss}) ⁽¹⁾	V _{CM} change steady state	-10		10	mV
V _{OD} ⁽²⁾	Differential output voltage magnitude		200		mV
V _{OD} (Δ)	V _{OD} change (between logic states)	-10		10	mV
V _{OH}	Single-ended output voltage high		1.00		V
V _{OL}	Single-ended output voltage low		0.80		V
t _R ⁽²⁾	Differential output rise time			250	ps
t _F ⁽²⁾	Differential output fall time			250	ps
t _{MAX}	Maximum switching rate			1200	Mbps
DC _{out}	Output duty cycle	45%	50%	55%	
T _{Xterm} ⁽¹⁾	Internal differential termination	80	100	120	Ω
T _{Xload}	100-Ω differential PCB trace (50-Ω transmission lines)	0.5		6	inches

(1) Definition of V_{CM} changes:

(2) Note that V_{OD} is the differential voltage swing measured across a 100-Ω termination resistance connected directly between the transmitter differential pins. |V_{OD}| is the magnitude of this voltage swing relative to 0. Rise and fall times are defined for the differential V_{OD} signal as follows:

Differential Output Signal

(Note V_{cm} is removed when the signals are viewed differentially)

6.9 Low-Speed SDR Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	ID	TEST CONDITIONS	MIN	MAX	UNIT
Operating voltage	V _{CC18} (all signal groups)		1.64	1.96	V
DC input high voltage	V _{IHD(DC)} Signal group 1	All	0.7 × V _{CC18}	V _{CC18} + 0.5	V
DC input low voltage ⁽¹⁾	V _{ILD(DC)} Signal group 1	All	−0.5	0.3 × V _{CC18}	V
AC input high voltage ⁽²⁾	V _{IHD(AC)} Signal group 1	All	0.8 × V _{CC18}	V _{CC18} + 0.5	V
AC input low voltage	V _{ILD(AC)} Signal group 1	All	−0.5	0.2 × V _{CC18}	V
Slew rate ⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾	Signal group 1		1	3.0	V/ns
	Signal group 2		0.25		
	Signal group 3		0.5		

- (1) V_{ILD(AC)} minimum applies to undershoot.
- (2) V_{IHD(AC)} maximum applies to overshoot.
- (3) Signal group 1 output slew rate for rising edge is measured between V_{ILD(DC)} to V_{IHD(AC)}.
- (4) Signal group 1 output slew rate for falling edge is measured between V_{IHD(DC)} to V_{ILD(AC)}.
- (5) Signal group 1: See [Figure 1](#).
- (6) Signal groups 2 and 3 output slew rate for rising edge is measured between V_{ILD(AC)} to V_{IHD(AC)}.

Figure 1. Low Speed (LS) I/O Input Thresholds

6.10 System Oscillators Timing Requirements

see ⁽¹⁾

PARAMETER		MIN	MAX	UNIT	
f_{clock}	Clock frequency, MOSC ⁽²⁾	24-MHz oscillator	23.998	24.002	MHz
t_c	Cycle time, MOSC ⁽²⁾	24-MHz oscillator	41.670	41.663	ns
$t_{w(H)}$	Pulse duration ⁽³⁾ , MOSC, high	50% to 50% reference points (signal)		40 t_c %	
$t_{w(L)}$	Pulse duration ⁽³⁾ , MOSC, low	50% to 50% reference points (signal)		40 t_c %	
t_t	Transition time ⁽³⁾ , MOSC, $t_t = t_f / t_r$	20% to 80% reference points (signal)		10	ns
t_{jp}	Long-term, peak-to-peak, period jitter ⁽³⁾ , MOSC (that is the deviation in period from ideal period due solely to high frequency jitter)			2%	

- (1) The I/O pin TSTPT_6 enables the ASIC to use two different oscillator frequencies through a pullup control at initial ASIC power-up. TSTPT_6 should be grounded so that 24 MHz is always selected.
- (2) The frequency accuracy for MOSC is ±200 PPM. This includes impact to accuracy due to aging, temperature, and trim sensitivity. The MOSC input cannot support spread spectrum clock spreading.
- (3) Applies only when driven through an external digital oscillator.

Figure 2. System Oscillators

6.11 Power-Up and Reset Timing Requirements

PARAMETER		MIN	MAX	UNIT
$t_{w(L)}$	Pulse duration, inactive low, RESETZ	50% to 50% reference points (signal)	1.25	μs
t_t	Transition time, RESETZ ⁽¹⁾ , $t_t = t_f / t_r$	20% to 80% reference points (signal)	0.5	μs

- (1) For more information on RESETZ, see [Pin Configuration and Functions](#).

Figure 3. Power-Up and Power-Down RESETZ Timing

6.12 Parallel Interface Frame Timing Requirements

			MIN	MAX	UNIT
t_{p_vsw}	Pulse duration – VSYNC_WE high	50% reference points	1		lines
t_{p_vbp}	Vertical back porch (VBP) – time from the leading edge of VSYNC_WE to the leading edge HSYNC_CS for the first active line (see ⁽¹⁾)	50% reference points	2		lines
t_{p_vfp}	Vertical front porch (VFP) – time from the leading edge of the HSYNC_CS following the last active line in a frame to the leading edge of VSYNC_WE (see ⁽¹⁾)	50% reference points	1		lines
t_{p_tvb}	Total vertical blanking – time from the leading edge of HSYNC_CS following the last active line of one frame to the leading edge of HSYNC_CS for the first active line in the next frame. (This is equal to the sum of VBP (t_{p_vbp}) + VFP (t_{p_vfp})).	50% reference points	See ⁽¹⁾		lines
t_{p_hsw}	Pulse duration – HSYNC_CS high	50% reference points	4	128	PCLKs
t_{p_hbp}	Horizontal back porch – time from rising edge of HSYNC_CS to rising edge of DATAEN_CMD	50% reference points	4		PCLKs
t_{p_hfp}	Horizontal front porch – time from falling edge of DATAEN_CMD to rising edge of HSYNC_CS	50% reference points	8		PCLKs
t_{p_thb}	Total horizontal blanking – sum of horizontal front and back porches	50% reference points	See ⁽²⁾		PCLKs

- (1) The minimum total vertical blanking is defined by the following equation: $t_{p_tvb}(\text{min}) = 6 + [6 \times \text{Max}(1, \text{Source_ALPF} / \text{DMD_ALPF})]$ lines where:
- (a) SOURCE_ALPF = Input source active lines per frame
 - (b) DMD_ALPF = Actual DMD used lines per frame supported
- (2) Total horizontal blanking is driven by the maximum line rate for a given source which will be a function of resolution and orientation. The following equation can be applied for this: $t_{p_thb} = \text{Roundup}[(1000 \times f_{\text{clock}}) / \text{LR}] - \text{APPL}$ where:
- (a) f_{clock} = Pixel clock rate in MHz
 - (b) LR = Line rate in kHz
 - (c) APPL is the number of active pixels per (horizontal) line.
 - (d) If t_{p_thb} is calculated to be less than $t_{p_hbp} + t_{p_hfp}$ then the pixel clock rate is too low or the line rate is too high, and one or both must be adjusted.

Figure 4. Parallel Interface Frame Timing

6.13 Parallel Interface General Timing Requirements

see ⁽¹⁾

			MIN	MAX	UNIT
f_{clock}	Clock frequency, PCLK		1.0	150.0	MHz
$t_{\text{p_clkper}}$	Clock period, PCLK	50% reference points	6.66	1000	ns
$t_{\text{p_clkjit}}$	Clock jitter, PCLK	Maximum f_{clock}	see ⁽²⁾	see ⁽²⁾	
$t_{\text{p_wh}}$	Pulse duration low, PCLK	50% reference points	2.43		ns
$t_{\text{p_wl}}$	Pulse duration high, PCLK	50% reference points	2.43		ns
$t_{\text{p_su}}$	Setup time – HSYNC_CS, DATEN_CMD, PDATA(23:0) valid before the active edge of PCLK	50% reference points	0.9		ns
$t_{\text{p_h}}$	Hold time – HSYNC_CS, DATEN_CMD, PDATA(23:0) valid after the active edge of PCLK	50% reference points	0.9		ns
t_{t}	Transition time – all signals	20% to 80% reference points	0.2	2.0	ns

- (1) The active (capture) edge of PCLK for HSYNC_CS, DATEN_CMD and PDATA(23:0) is software programmable, but defaults to the rising edge.
- (2) Clock jitter (in ns) should be calculated using this formula: $\text{Jitter} = [1 / f_{\text{clock}} - 5.76 \text{ ns}]$. Setup and hold times must be met during clock jitter.

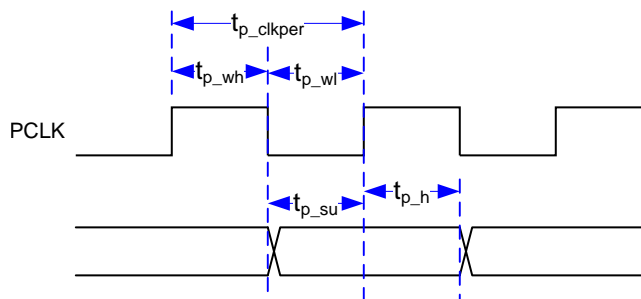

Figure 5. Parallel Interface General Timing

6.14 BT.656 Interface General Timing Requirements

The DLPC3432 ASIC input interface supports the industry standard BT.656 parallel video interface. See the appropriate ITU-R BT.656 specification for detailed interface timing requirements.⁽¹⁾

			MIN	MAX	UNIT
f_{clock}	Clock frequency, PCLK		1.0	33.5	MHz
$t_{\text{p_clkper}}$	Clock period, PCLK	50% reference points	29.85	1000	ns
$t_{\text{p_clkjit}}$	Clock jitter, PCLK	Maximum f_{clock}	See ⁽²⁾	See ⁽²⁾	
$t_{\text{p_wh}}$	Pulse duration low, PCLK	50% reference points	10.0		ns
$t_{\text{p_wl}}$	Pulse duration high, PCLK	50% reference points	10.0		ns
$t_{\text{p_su}}$	Setup time – PDATA(7:0) before the active edge of PCLK	50% reference points	3.0		ns
$t_{\text{p_h}}$	Hold time – PDATA(7:0) after the active edge of PCLK	50% reference points	0.9		ns
t_{t}	Transition time – all signals	20% to 80% reference points	0.2	3.0	ns

- (1) The BT.656 interface accepts 8-bits per color, 4:2:2 YCb/Cr data encoded per the industry standard through PDATA(7:0) on the active edge of PCLK (that is programmable). See Figure 6.
- (2) Clock jitter should be calculated using this formula: Jitter = $[1 / f_{\text{clock}} - 5.76 \text{ ns}]$. Setup and hold times must be met during clock jitter.

Figure 6. DLPC3432 PDATA Bus – BT.656 Interface Mode Bit Mapping

6.15 DSI Host Timing Requirements

This section describes timing requirements for specific host minimum values that are higher than those specified in the MIPI standards. It is critical for proper operation that the host meet these minimum timing requirements for specified MIPI parameters.

			MIN	MAX	UNIT
Supported Frequency Lane	Clock Lane		80	235	MHz
	Data Lane	Effective data rate	160	470	Mbps
		Number of data lanes	Selectable	1	4
$T_{\text{HS-PREPARE}} + T_{\text{HS-ZERO}}$	During a LP to HS transition, the time that the transmitter drives the HS-0 state prior to transmitting the sync sequence	80 MHz to 94 MHz HS clock	565		ns
		95 MHz to 235 MHz HS clock ⁽¹⁾	465 ⁽²⁾		ns
$T_{\text{HS-SETTLE}}$	Time interval during which the HS receiver shall ignore any data lane HS transitions, starting from the beginning of $T_{\text{HS-PREPARE}}$. The HS receiver shall ignore any data lane transitions before the minimum value, and shall respond to any data lane transitions after the maximum value	80 MHz to 94 MHz HS clock		565 ⁽³⁾	ns
		95 MHz to 235 MHz HS clock		465 ⁽³⁾	ns

- (1) Example: At 172 MHz and $T_{\text{HS-PREPARE}} = 51.46 \text{ ns}$ to $51.46 \text{ ns} + T_{\text{HS-ZERO}} \geq 465 \text{ ns}$. Therefore $T_{\text{HS-ZERO}} \geq 413.54 \text{ ns}$.
- (2) Minimum values are higher than those required by the MIPI standard. $T_{\text{HS-PREPARE}}$ must be within the MIPI specified range.
- (3) Maximum values are higher than those required by the MIPI standard.

6.16 Flash Interface Timing Requirements

The DLPC3432 ASIC flash memory interface consists of a SPI flash serial interface with a programmable clock rate. The DLPC3432 can support 1- to 16-Mb flash memories.⁽¹⁾⁽²⁾

			MIN	MAX	UNIT
f_{clock}	Clock frequency, SPI_CLK	See ⁽³⁾	1.42	36.0	MHz
$t_{\text{p_clkper}}$	Clock period, SPI_CLK	50% reference points	704	27.7	ns
$t_{\text{p_wh}}$	Pulse duration low, SPI_CLK	50% reference points	352		ns
$t_{\text{p_wl}}$	Pulse duration high, SPI_CLK	50% reference points	352		ns
t_{t}	Transition time – all signals	20% to 80% reference points	0.2	3.0	ns
$t_{\text{p_su}}$	Setup time – SPI_DIN valid before SPI_CLK falling edge	50% reference points	10.0		ns
$t_{\text{p_h}}$	Hold time – SPI_DIN valid after SPI_CLK falling edge	50% reference points	0.0		ns
$t_{\text{p_clqv}}$	SPI_CLK clock falling edge to output valid time – SPI_DOUT and SPI_CSZ	50% reference points		1.0	ns
$t_{\text{p_clqx}}$	SPI_CLK clock falling edge output hold time – SPI_DOUT and SPI_CSZ	50% reference points	-3.0	3.0	ns

- (1) Standard SPI protocol is to transmit data on the falling edge of SPI_CLK and capture data on the rising edge. The DLPC3432 does transmit data on the falling edge, but it also captures data on the falling edge rather than the rising edge. This provides support for SPI devices with long clock-to-Q timing. DLPC3432 hold capture timing has been set to facilitate reliable operation with standard external SPI protocol devices.
- (2) With the above output timing, DLPC3432 provides the external SPI device 8.2-ns input set-up and 8.2-ns input hold, relative to the rising edge of SPI_CLK.
- (3) This range include the 200 ppm of the external oscillator (but no jitter).

Figure 7. Flash Interface Timing

7 Parameter Measurement Information

7.1 HOST_IRQ Usage Model

- While reset is applied, HOST_IRQ will reset to the tri-state condition (an external pullup pulls the line high).
- HOST_IRQ will remain tri-state (pulled high externally) until the microprocessor boot completes. While the signal is pulled high, this indicates that the ASIC is performing boot-up and auto-initialization.
- As soon as possible after boot-up, the microprocessor will drive HOST_IRQ to a logic high state to indicate that the ASIC is continuing to perform auto-initialization (no real state change occurs on the external signal).
- Upon completion of auto-initialization, software will set HOST_IRQ to a logic low state to indicate the completion of auto-initialization. At the falling edge, the system is said to enter the INIT_DONE state.
- The 500-ms maximum shown from the rising edge of RESETZ to the falling edge of HOST_IRQ may become longer than 500 ms if many commands are added to the autoinit batch file in flash which automatically runs at power up.

Figure 8. Host IRQ Timing

7.2 Input Source

Table 2. Supported Input Source Ranges⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

INTERFACE	BITS / PIXEL ⁽⁵⁾	IMAGE TYPE	SOURCE RESOLUTION RANGE ⁽⁶⁾				FRAME RATE RANGE
			HORIZONTAL		VERTICAL		
			Landscape	Portrait	Landscape	Portrait	
Parallel	24 maximum	2D only	320 to 960	200 to 540	200 to 540	320 to 960	10 to 122 Hz
BT.656-NTSC ⁽⁷⁾	See ⁽⁸⁾	2D only	720	N/A	240	N/A	60 ± 2 Hz
BT.656-PAL ⁽⁷⁾	See ⁽⁸⁾	2D only	720	N/A	288	N/A	50 ± 2 Hz

- (1) The user must stay within specifications for all source interface parameters such as maximum clock rate and maximum line rate.
- (2) The maximum DMD size for all rows in the table is 960 × 540.
- (3) To achieve the ranges stated, the composer-created firmware used must be defined to support the source parameters used.
- (4) These interfaces are supported with the DMD sequencer sync mode command (3Bh) set to auto.
- (5) Bits / Pixel does not necessarily equal the number of data pins used on the DLPC3432. Fewer pins are used if multiple clocks are used per pixel transfer.
- (6) By using an I²C command, portrait image inputs can be rotated on the DMD by -90° so that the image is displayed in landscape format.
- (7) All parameters in this row follow the BT.656 standard. The image format is always landscape.
- (8) BT.656 uses 16-bit 4:2:2 YCr/Cb.

7.2.1 Input Source - Frame Rates and 3D Display Orientation

For 3D sources on the parallel or MIPI DSI interface, images must be frame sequential (L, R, L, ...) when input to the DLPC343x. Any processing required to unpack 3D images and to convert them to frame sequential must be done by external electronics prior to inputting the images to the DLPC343x. Each 3D source frame input must contain a single eye frame of data separated by a VSYNC where an eye frame contains image data for a single left or right eye. The signal 3DR input to the DLPC343x tells whether the input frame is for the left eye or right eye. The signal 3DR input to the DLPC343x tells whether the input frame is for the left eye or right eye.

Each DMD frame will be displayed at the same rate as the input interface frame rate. Typical timing for a 50-Hz or 60-Hz 3D HDMI source frame, the input interface of the DLPC343x, and the DMD is shown in [Figure 9](#). GPIO_04 is optionally sent to a transmitter on the system PCB for wirelessly transmitting a sync signal to 3D glasses. The glasses are then in phase with the DMD images being displayed. Alternately, [3D Glasses Operation](#) shows how DLP link pulses can be used instead.

Figure 9. DLPC343x L/R Frame and Signals Timing

7.2.2 Parallel Interface Supports Six Data Transfer Formats

- 24-bit RGB888 or 24-bit YCrCb888 on a 24 data wire interface
- 18-bit RGB666 or 18-bit YCrCb666 on an 18 data wire interface
- 16-bit RGB565 or 16-bit YCrCb565 on a 16 data wire interface
- 16-bit YCrCb 4:2:2 (standard sampling assumed to be Y0Cb0, Y1Cr0, Y2Cb2, Y3Cr2, Y4Cb4, Y5Cr4, ...)
- 8-bit RGB888 or 8-bit YCrCb888 serial (1 color per clock input; 3 clocks per displayed pixel)
 - On an 8 wire interface
- 8-bit YCrCb 4:2:2 serial (1 color per clock input; 2 clocks per displayed pixel)
 - On an 8 wire interface

PDATA Bus – Parallel Interface Bit Mapping Modes shows the required PDATA(23:0) bus mapping for these six data transfer formats.

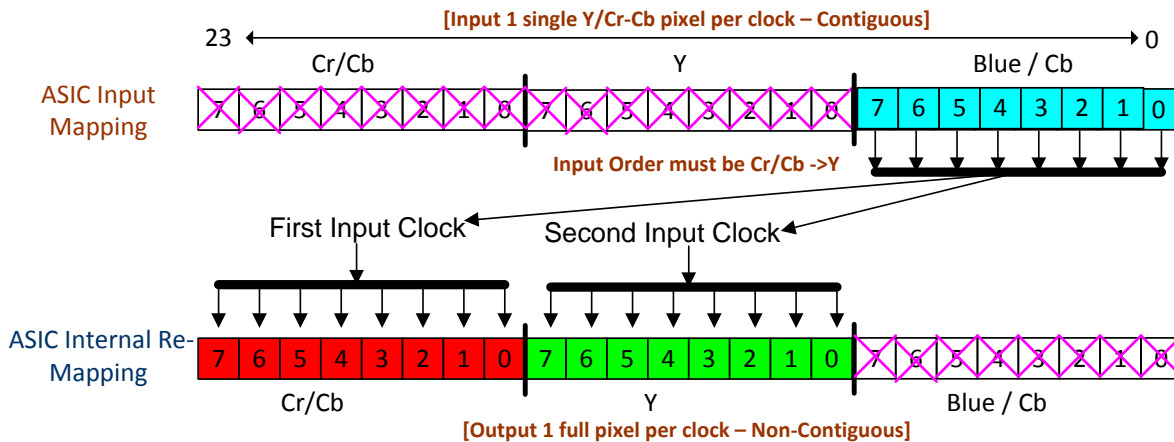

Figure 15. 8-Bit Serial YCrCb-422 I/O Mapping

7.2.2.2 DSI Interface - Supported Data Transfer Formats

- 24-bit RGB888 - each pixel using 3 bytes (DSI data type = 0x3E)
- 18-bit RGB666 - packed (DSI data type = 0x1E)
- 18-bit RGB666 - loosely packed into 3 bytes (DSI data type = 0x2E)
- 16-bit RGB565 - each pixel using 2 bytes (DSI data type = 0x0E)
- 16-bit 4:2:2 YCbCr - packed (DSI data type = 0x2C)

8 Detailed Description

8.1 Overview

The DLPC3432 is the display controller for the DLP230 (.23 qHD) DMD. The DLPC3432 is part of the chipset comprised of the DLPC3432 controller, the DLP230 DMD, and the DLPA2000 PMIC and LED driver. All three components of the chipset must be used in conjunction with each other for reliable operation of the DLP230 DMD. The DLPC3432 display controller provides interfaces along with data and image processing functions that are optimized for small form factor and power-constrained display applications. Applications include projection within cell phones, cameras, camcorders, tablets, pico projectors, wearable displays, and digital signage. Standalone projectors must include a separate front-end chip to interface to the outside world (for example, video decoder, HDMI receiver, triple ADC, or USB I/F chip).

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Interface Timing Requirements

This section defines the timing requirements for the external interfaces of the DLPC3432 ASIC.

8.3.1.1 Parallel Interface

The parallel interface complies with standard graphics interface protocol, which includes a vertical sync signal (VSYNC_WE), horizontal sync signal (HSYNC_CS), optional data valid signal (DATAEN_CMD), a 24-bit data bus (PDATA), and a pixel clock (PCLK). The polarity of both syncs and the active edge of the clock are programmable. Figure 4 shows the relationship of these signals. The data valid signal (DATAEN_CMD) is optional in that the DLPC3432 provides auto-framing parameters that can be programmed to define the data valid window based on pixel and line counting relative to the horizontal and vertical syncs.

In addition to these standard signals, an optional side-band signal (PDM_CVS_TE) is available, which allows periodic frame updates to be stopped without losing the displayed image. When PDM_CVS_TE is active, it acts as a data mask and does not allow the source image to be propagated to the display. A programmable PDM polarity parameter determines if it is active high or active low. This parameter defaults to make PDM_CVS_TE active high; if this function is not desired, then it should be tied to a logic low on the PCB. PDM_CVS_TE is restricted to change only during vertical blanking.

NOTE

VSYNC_WE must remain active at all times (in lock-to-VSYNC mode) or the display sequencer will stop and cause the LEDs to be turned off.

8.3.1.2 Display Serial Interface DSI

The DPP3432 input interface supports the industry standard DSI type-3 LVDS video interface up to 4-lanes. DSI is a source synchronous, high speed, low power, low cost physical layer. The DSI-PHY unit is responsible for the reception of data in high speed (HS) or reception and transmission of data in low power (LP) mode for unidirectional data lanes. Point-to-point lane interconnect can be used for either data or clock signal transmission. The high speed receiver is a differential line receiver while the low-power receiver is an un-terminated, single-ended receiver circuit. Figure 16 shows a single lane module with PPI interface.

For a given frame rate, the DSI high-speed (HS) clock frequency must be fixed. If a different DSI clock rate is ever needed to support another frame rate, the I²C command "Write DSI Parameters (BDh)" must be sent to the DLPC3432 to retrieve the new DSI clock frequency.

- Compliant with DSI-MIPI specification for display serial interface (V 1.02.00)
- Compliant with D-PHY standard MIPI specification (V 1.0)
- MIPI DSI type 3 architecture
- Supports display resolutions from 320×200 to 1280×800
- Supports video mode (command mode not supported)
- Commands sent over I²C (MIPI DCS commands sent over DSI not supported)
- Supports multiple packets per transmission
- Supports trigger messages in the forward direction.
- Data lanes configurable from one to four channels
- EOT (end of transfer) command is supported and must be enabled.
- CRC and ECC (error correction code) for header supported. CRC and ECC can be disabled.
- Checksum for long packets with error reporting (but no ECC)
- Supports one virtual channel for video mode
- Supports burst mode
- Supports non-curst with sync pulses and with sync event
- BTA (bus turn-around) mode not supported and must be disabled in the DSI host processor
- LP (low power) mode supported (during V blanking and sync but not between pixel lines)

Feature Description (continued)

Figure 16. DSI - High Level View

The differential DSI clock lane (DCLKN:DCLKP) must be in the LP11 (Idle) state upon the de-assertion of RESETZ (i.e. zero-to-one transition) and must remain in this state for a minimum of 100 µsec thereafter to ensure proper DSI initialization.

Differential data lane '0' (DDON:DD0P) is required for DSI operation with the remaining three data lanes being optional or implementation specific as needed.

The state of GPIO (2:1) pins upon the de-assertion of RESETZ (i.e. a zero-to-one transition) will determine the number of DSI data lanes that will be enabled for both LP and HS bus operation.

8.4 Serial Flash Interface

DLPC3432 uses an external SPI serial flash memory device for configuration support. The minimum required size is dependent on the desired minimum number of sequences, CMT tables, and splash options while the maximum supported is 16 Mb.

For access to flash, the DLPC3432 uses a single SPI interface operating at a programmable frequency complying to industry standard SPI flash protocol. The programmable SPI frequency is defined to be equal to 180 MHz/N, where N is a programmable value between 5 to 127 providing a range from 36.0 to 1.41732 MHz. Note that this results in a relatively large frequency step size in the upper range (for example, 36 MHz, 30 MHz, 25.7 MHz, 22.5 MHz, and so forth) and thus this must be taken into account when choosing a flash device.

The DLPC3432 supports two independent SPI chip selects; however, the flash must be connected to SPI chip select zero (SPI0_CSZ0) because the boot routine is only executed from the device connected to chip select zero (SPI0_CSZ0). The boot routine uploads program code from flash to program memory, then transfers control to an auto-initialization routine within program memory. The DLPC3432 asserts the HOST_IRQ output signal high while auto-initialization is in progress, then drives it low to signal its completion to the host processor. Only after auto-initialization is complete will the DLPC3432 be ready to receive commands through I²C.

The DLPC3432 should support any flash device that is compatible with the modes of operation, features, and performance as defined in [Table 3](#) and [Table 4](#).

Table 3. SPI Flash Required Features or Modes of Operation

FEATURE	DLPC3432 REQUIREMENT
SPI interface width	Single
SPI protocol	SPI mode 0
Fast READ addressing	Auto-incrementing
Programming mode	Page mode
Page size	256 B
Sector size	4 kB sector
Block size	Any
Block protection bits	0 = Disabled

Serial Flash Interface (continued)
Table 3. SPI Flash Required Features or Modes of Operation (continued)

FEATURE	DLPC3432 REQUIREMENT
Status register bit(0)	Write in progress (WIP), also called flash busy
Status register bit(1)	Write enable latch (WEN)
Status register bits(6:2)	A value of 0 disables programming protection
Status register bit(7)	Status register write protect (SRWP)
Status register bits(15:8) (that is expansion status byte)	The DLPC3432 only supports single-byte status register R/W command execution, and thus may not be compatible with flash devices that contain an expansion status byte. However, as long as the expansion status byte is considered optional in the byte 3 position and any write protection control in this expansion status byte defaults to unprotected, then the device should be compatible with the DLPC3432.

To support flash devices with program protection defaults of either enabled or disabled, the DLPC3432 always assumes the device default is enabled and goes through the process of disabling protection as part of the boot-up process. This process consists of:

- A write enable (WREN) instruction executed to request write enable, followed by
- A read status register (RDSR) instruction is then executed (repeatedly as needed) to poll the write enable latch (WEL) bit
- After the write enable latch (WEL) bit is set, a write status register (WRSR) instruction is executed that writes 0 to all 8-bits (this disables all programming protection)

Prior to each program or erase instruction, the DLPC3432 issues:

- A write enable (WREN) instruction to request write enable, followed by
- A read status register (RDSR) instruction (repeated as needed) to poll the write enable latch (WEL) bit
- After the write enable latch (WEL) bit is set, the program or erase instruction is executed
- Note the flash automatically clears the write enable status after each program and erase instruction

The specific instruction OpCode and timing compatibility requirements are listed in [Table 4](#) and [Table 5](#). Note however that the DLPC3432 does not read the flash's electronic signature ID and thus cannot automatically adapt protocol and clock rate based on the ID.

Table 4. SPI Flash Instruction OpCode and Access Profile Compatibility Requirements

SPI FLASH COMMAND	FIRST BYTE (OPCODE)	SECOND BYTE	THIRD BYTE	FOURTH BYTE	FIFTH BYTE	SIXTH BYTE
Fast READ (1 Output)	0x0B	ADDRS(0)	ADDRS(1)	ADDRS(2)	dummy	DATA(0) ⁽¹⁾
Read status	0x05	n/a	n/a	STATUS(0)		
Write status	0x01	STATUS(0)	⁽²⁾			
Write enable	0x06					
Page program	0x02	ADDRS(0)	ADDRS(1)	ADDRS(2)	DATA(0) ⁽¹⁾	
Sector erase (4 kB)	0x20	ADDRS(0)	ADDRS(1)	ADDRS(2)		
Chip erase	0xC7					

(1) Only the first data byte is shown, data continues.

(2) The DLPC3432 does not support access to a second/expansion write status byte.

The specific timing compatibility requirements for a DLPC3432 compatible flash are listed in [Table 5](#) and [Table 6](#).

Table 5. SPI Flash Key Timing Parameter Compatibility Requirements⁽¹⁾⁽²⁾

SPI FLASH TIMING PARAMETER	SYMBOL	ALTERNATE SYMBOL	MIN	MAX	UNIT
Access frequency (all commands)	FR	f_C	≤ 1.42		MHz
Chip select high time (also called chip select deselect time)	t_{SHSL}	t_{CSH}	≤ 200		ns
Output hold time	t_{CLQX}	t_{HO}	≥ 0		ns
Clock low to output valid time	t_{CLQV}	t_V		≤ 11	ns
Data in set-up time	t_{DVCH}	t_{DSU}	≤ 5		ns
Data in hold time	t_{CHDX}	t_{DH}	≤ 5		ns

(1) The timing values are related to the specification of the flash device itself, not the DLPC3432.

(2) The DLPC3432 does not drive the HOLD or WP (active low write protect) pins on the flash device, and thus these pins should be tied to a logic high on the PCB through an external pullup.

The DLPC3432 supports 1.8-, 2.5-, or 3.3-V serial flash devices. To do so, V_{CC_FLSH} must be supplied with the corresponding voltage. [Table 6](#) contains a list of 1.8-V, 2.5-V, and 3.3-V compatible SPI serial flash devices supported by DLPC3432.

Table 6. DLPC3432 Compatible SPI Flash Device Options^{(1) (2)}

DVT ⁽³⁾	DENSITY (Mb)	VENDOR	PART NUMBER	PACKAGE SIZE
1.8-V COMPATIBLE DEVICES				
Yes	4 Mb	Winbond	W25Q40EWUXIE	2.00 mm x 3.00 mm USON
Yes	4 Mb	Macronix	MX25U4033EBAI-12G	1.43 mm x 1.94 mm WLCSP
Yes	8 Mb	Macronix	MX25U8033EBAI-12G	1.68 mm x 1.99 mm WLCSP
2.5-V OR 3.3-V COMPATIBLE DEVICES				
Yes	16 Mb	Winbond	W25Q16JLZPIG	5.00 mm x 6.00 mm WSON

(1) The flash supply voltage must match V_{CC_FLSH} on the DLPC3432. Special attention is needed when ordering devices to be sure the desired supply voltage is attained as multiple voltage options are often available under the same base part number.

(2) Beware when considering Numonyx (Micron) serial flash devices as they typically do not have the 4 kB sector size needed to be DLPC3432 compatible.

(3) All of these flash devices appear compatible with the DLPC3432, but only those marked with 'yes' in the DVT column have been validated on the EVM3432 reference design. Those marked with no can be used at the ODM's own risk.

8.4.1 Serial Flash Programming

Note that the flash can be programmed through the DLPC3432 over I²C or by driving the SPI pins of the flash directly while the DLPC3432 I/O are tri-stated. SPI0_CLK, SPI0_DOUT, and SPI0_CSZ0 I/O can be tri-stated by holding RESETZ in a logic low state while power is applied to the DLPC3432. Note that SPI0_CSZ1 is not tri-stated by this same action.

8.4.2 SPI Signal Routing

The DLPC3432 is designed to support two SPI slave devices on the SPI0 interface, specifically, a serial flash and the DLPA2000. This requires routing associated SPI signals to two locations while attempting to operate up to 36 MHz. Take special care to ensure that reflections do not compromise signal integrity. To this end, the following recommendations are provided:

- The SPI0_CLK PCB signal trace from the DLPC3432 source to each slave device should be split into separate routes as close to the DLPC3432 as possible. In addition, the SPI0_CLK trace length to each device should be equal in total length.
- The SPI0_DOUT PCB signal trace from the DLPC3432 source to each slave device should be split into separate routes as close to the DLPC3432 as possible. In addition, the SPI0_DOUT trace length to each device should be equal in total length (use the same strategy as SPI0_CLK).
- The SPI0_DIN PCB signal trace from each slave device to the point where they intersect on their way back to the DLPC3432 should be made equal in length and as short as possible. They should then share a common trace back to the DLPC3432.
- SPI0_CSZ0 and SPI0_CSZ1 need no special treatment because they are dedicated signals which drive only one device.

8.4.3 I²C Interface Performance

Both DLPC3432 I²C interface ports support 100-kHz baud rate. By definition, I²C transactions operate at the speed of the slowest device on the bus, thus there is no requirement to match the speed grade of all devices in the system.

8.4.4 Content-Adaptive Illumination Control

Content-adaptive illumination control (CAIC) is an image processing algorithm that takes advantage of the fact that in common real-world image content, most pixels in the images are well below full scale for the R, G, and B digital channels being input to the DLPC3432. As a result of this, the average picture level (APL) for the overall image is also well below full scale and the system's dynamic range for the collective set of pixel values is not fully utilized. CAIC takes advantage of this headroom between the source image APL and the top of the available dynamic range of the display system.

CAIC evaluates images frame by frame and derives three unique digital gains, one for each of the R, G, and B color channels. During CAIC image processing, each gain is applied to all pixels in the associated color channel. CAIC derives each color channel's gain that is applied to all pixels in that channel so that the pixels as a group collectively shift upward and as close to full scale as possible. To prevent any image quality degradation, the gains are set at the point where just a few pixels in each color channel are clipped. [Figure 17](#) and [Figure 18](#) show an example of the application of CAIC for one color channel.

Figure 17. Input Pixels Example

Figure 18. Displayed Pixels After CAIC Processing

Figure 18 shows the gain that is applied to a color processing channel inside the DLPC3432. CAIC will also adjust the power for the R, G, and B LED. For each color channel of an individual frame, CAIC will intelligently determine the optimal combination of digital gain and LED power. The decision regarding how much digital gain to apply to a color channel and how much to adjust the LED power for that color is heavily influenced by the software command settings sent to the DLPC3432 for configuring CAIC.

As CAIC applies a digital gain to each color channel independently, and adjusts each LED’s power independently, CAIC also makes sure that the resulting color balance in the final image matches the target color balance for the projector system. Thus, the effective displayed white point of images is held constant by CAIC from frame to frame.

Since the R, G, and B channels can be gained up by CAIC inside the DLPC3432, the LED power can be turned down for any color channel until the brightness of the color on the screen is unchanged. Thus, CAIC can achieve an overall LED power reduction while maintaining the same overall image brightness as if CAIC was not used. Figure 19 shows an example of LED power reduction by CAIC for an image where the R and B LEDs can be turned down in power.

CAIC can alternatively be used to increase the overall brightness of an image while holding the total power for all LEDs constant. In summary, when CAIC is enabled CAIC can operate in one of two distinct modes:

- Power Reduction Mode – holds overall image brightness constant while reducing LED power
- Enhanced Brightness Mode – holds overall LED power constant while enhancing image brightness

Figure 19. CAIC Power Reduction Mode (for Constant Brightness)

8.4.5 Local Area Brightness Boost

Local area brightness boost (LABB), is an image processing algorithm that adaptively gains up regions of an image that are dim relative to the average picture level. Some regions of the image will have significant gain applied, and some regions will have little or no gain applied. LABB evaluates images frame by frame and derives the local area gains to be used uniquely for each image. Since many images have a net overall boost in gain even if some parts of the image get no gain, the overall perceived brightness of the image is boosted.

Figure 20 shows a split screen example of the impact of the LABB algorithm for an image that includes dark areas.

Figure 20. Boosting Brightness in Local Areas of an Image

LABB works best when the decision about the strength of gains used is determined by ambient light conditions. For this reason, there is an option to add an ambient light sensor which can be read by the DLPC3432 during each frame. Based on the sensor readings, LABB will apply higher gains for bright rooms to help overcome any washing out of images. LABB will apply lower gains in dark rooms to prevent over-punching of images.

8.4.6 3D Glasses Operation

Left and right eye shuttering is a feature in glasses with displayed DMD image frames.

Two different types of glasses are often used to achieve synchronization. One relies on an IR transmitter on the system PCB to send an IR sync signal to an IR receiver in the glasses. In this case, the DLPC3432 output signal GPIO_04 can be used to cause the IR transmitter to send an IR sync signal to the glasses. The timing for signal GPIO_04 is shown in [Figure 9](#).

The second type of glasses relies on sync information that is encoded into the light output from the projection lens. This is referred to as the DLP link approach for 3D, and many 3D glasses from different suppliers have been built using this method. This demonstrates that the DLP link method can work reliably. The advantage of the DLP link approach is that it takes advantage of existing projector hardware to transmit the sync information to the glasses. This can save cost, size and power in the projector.

For generating the DLP link sync information, one light pulse per DMD frame is output from the projection lens while the glasses have both shutters closed. To achieve this, the DLPC3432 signals the DLPA2000 or DLPA2005 when to turn on the illumination source (typically LEDs or lasers) so that an encoded light pulse is output once per DMD frame. Since the shutters in the glasses are both off when the DLP link pulse is sent, the projector illumination source will also be off except for the when light is sent to create the DLP link pulse. The timing of the light pulses for the DLP link 3D operation is shown in [Figure 21](#) and [Figure 22](#).

Figure 21. DLPC3432 L/R Frame and Signal Timing

Figure 22. 3D DLP Link Pulse Timing

8.4.7 DMD (Sub-LVDS) Interface

The DLPC3432 ASIC DMD interface consists of a high speed 1.8-V sub-LVDS output-only interface with a maximum clock speed of 600-MHz DDR and a low speed SDR (1.8-V LVCMOS) interface with a fixed clock speed of 120 MHz. The DLPC3432 sub-LVDS interface supports a number of DMD display sizes, and as a function of resolution, not all output data lanes are needed as DMD display resolutions decrease in size. With internal software selection, the DLPC3432 also supports a limited number of DMD interface swap configurations that can help board layout by remapping specific combinations of DMD interface lines to other DMD interface lines as needed. Table 7 shows the four options available for the DLP230 (.23 qHD) DMD specifically. Any unused DMD signal pairs should be left unconnected on the final board design.

Table 7. DLP230 (.23 qHD) DMD – ASIC to 4-Lane DMD Pin Mapping Options

DLPC343x ASIC 8 LANE DMD ROUTING OPTIONS		DMD PINS
OPTION 1 Swap Control = x0	OPTION 2 Swap Control = x2

8.4.8 DLPC3432 System Design Consideration – Application Notes

For system power regulation, it is acceptable for $V_{DD_PLL D}$ and $V_{DD_PLL M}$ to be derived from the same regulator as the core V_{DD} , but to minimize the AC noise component they should be filtered as recommended in the [PCB Layout Guidelines for Internal ASIC PLL Power](#).

8.4.9 Calibration and Debug Support

The DLPC3432 contains a test point output port, TSTPT_(7:0), which provides selected system calibration support as well as ASIC debug support. These test points are inputs while reset is applied and switch to outputs when reset is released. The state of these signals is sampled upon the release of system reset and the captured value configures the test mode until the next time reset is applied. Each test point includes an internal pulldown resistor, thus external pullups must be used to modify the default test configuration. The default configuration (x000) corresponds to the TSTPT_(7:0) outputs remaining tri-stated to reduce switching activity during normal operation. For maximum flexibility, an option to jumper to an external pullup is recommended for TSTPT_(2:0). Pullups on TSTPT_(6:3) are used to configure the ASIC for a specific mode or option. TI does not recommend adding pullups to TSTPT_(7:3) because this has adverse affects for normal operation. This external pullup is only sampled upon a 0-to-1 transition on the RESETZ input, thus changing their configuration after reset is released will not have any effect until the next time reset is asserted and released. [Table 8](#) defines the test mode selection for one programmable scenario defined by TSTPT(2:0).

Table 8. Test Mode Selection Scenario Defined by TSTPT(2:0)⁽¹⁾

TSTPT(2:0) CAPTURE VALUE	NO SWITCHING ACTIVITY	CLOCK DEBUG OUTPUT
	x000	x010
TSTPT(0)	HI-Z	60 MHz
TSTPT(1)	HI-Z	30 MHz
TSTPT(2)	HI-Z	0.7 to 22.5 MHz
TSTPT(3)	HI-Z	HIGH
TSTPT(4)	HI-Z	LOW
TSTPT(5)	HI-Z	HIGH
TSTPT(6)	HI-Z	HIGH
TSTPT(7)	HI-Z	7.5 MHz

(1) These are only the default output selections. Software can reprogram the selection at any time.

8.4.10 DMD Interface Considerations

The sub-LVDS high speed interface waveform quality and timing on the DLPC3432 ASIC is dependent on the total length of the interconnect system, the spacing between traces, the characteristic impedance, etch losses, and how well matched the lengths are across the interface. Thus, ensuring a positive timing margin requires attention to many factors.

As an example, the DMD interface system timing margin can be calculated as follows:

$$\text{Setup Margin} = (\text{DLPC3432 output setup}) - (\text{DMD input setup}) - (\text{PCB routing mismatch}) - (\text{PCB SI degradation}) \quad (1)$$

$$\text{Hold-time Margin} = (\text{DLPC3432 output hold}) - (\text{DMD input hold}) - (\text{PCB routing mismatch}) - (\text{PCB SI degradation}) \quad (2)$$

where PCB SI degradation is signal integrity degradation due to PCB effects which include simultaneously switching output (SSO) noise, cross-talk and inter-symbol interference (ISI) noise.

The DLPC3432 I/O timing parameters as well as DMD I/O timing parameters can be found in their corresponding data sheets. Similarly, PCB routing mismatch can be budgeted and met through controlled PCB routing. However, PCB SI degradation is a more complicated adjustment.

In an attempt to minimize the signal integrity analysis that would otherwise be required, the following PCB design guidelines are provided as a reference of an interconnect system that will satisfy both waveform quality and timing requirements (accounting for both PCB routing mismatch and PCB SI degradation). Variation from these recommendations may also work, but should be confirmed with PCB signal integrity analysis or lab measurements.

DMD_HS Differential Signals

DMD_LS Signals

Figure 24. DMD Interface Board Stack-Up Details

8.5 Device Functional Modes

The DLPC3432 has two functional modes (ON/OFF) controlled by a single pin PROJ_ON:

- When pin PROJ_ON is set high, the projector automatically powers up and an image is projected from the DMD.
- When pin PROJ_ON is set low, the projector automatically powers down and only microwatts of power are consumed.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DLPC3432 controller is required to be coupled with the DLP230 DMD to provide a reliable display solution for many data and video display applications. The DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions, with the primary direction being into a projection or collection optic. Each application is derived primarily from the optical architecture of the system and the format of the data coming into the DLPC3432. Applications of interest include projection embedded in display devices like smart phones, tablets, cameras, and camcorders. Other applications include wearable (near-eye) displays, battery powered mobile accessories, interactive displays, low latency gaming displays, and digital signage.

9.2 Typical Application

A common application when using the DLPC3432 controller with the DLP230 DMD and DLPA2000 PMIC/LED driver is creating a Pico projector embedded in a handheld product. For example, a Pico projector may be embedded in a smart phone, a tablet, a camera, or camcorder. The DLPC3432 in the Pico projector embedded module typically receives images from a host processor within the product.

Projector Module Electronics

Typical Application (continued)

9.2.1 Design Requirements

A Pico projector is created by using a DLP chipset comprised of the DLP230 (.23 qHD) DMD, the DLPC3432 controller, and the DLPA2000 PMIC/LED driver. The DLPC3432 performs the digital image processing, the DLPA2000 provides the needed analog functions for the projector, and the DMD is the display device for producing the projected image.

In addition to the three DLP chips in the chipset, other chips may be needed. At a minimum, a flash part is needed to store the software and firmware to control the DLPC3432.

The illumination light that is applied to the DMD is typically from red, green, and blue LEDs. These are often contained in three separate packages, but sometimes more than one color of LED die may be in the same package to reduce the overall size of the pico-projector.

For connecting the DLPC3432 to the host processing for receiving images, a parallel interface is used. I²C should be connected to the host processor for sending commands to the DLPC3432.

The only power supplies needed external to the projector are the battery (SYSPWR) and a regulated 1.8-V supply.

The entire pico-projector can be turned on and off by using a single signal called PROJ_ON. When PROJ_ON is high, the projector turns on and begins displaying images. When PROJ_ON is set low, the projector turns off and draws just microamps of current on SYSPWR. When PROJ_ON is set low, the 1.8 V supply can continue to be left at 1.8 V and used by other non-projector sections of the product. If PROJ_ON is low, the DLPA2000 will not draw current on the 1.8-V supply.

9.2.2 Detailed Design Procedure

For connecting together the DLP230 (.23 qHD) DMD, the DLPC3432 controller, and the DLPA2000 PMIC/LED driver, see the reference design schematic. When a circuit board layout is created from this schematic a very small circuit board is possible. An example small board layout is included in the reference design data base. Follow the layout guidelines in [Layout](#) to achieve a reliable projector.

The optical engine that has the LED packages and the DMD mounted to it is typically supplied by an optical OEM who specializes in designing optics for DLP projectors.

9.2.3 Application Curve

As the LED currents that are driven time-sequentially through the red, green, and blue LEDs are increased, the brightness of the projector increases. This increase is somewhat non-linear, and the curve for typical white screen lumens changes with LED currents is shown in [Figure 25](#). For the LED currents shown, it is assumed that the same current amplitude is applied to the red, green, and blue LEDs.

Figure 25. Luminance vs Current

10 Power Supply Recommendations

10.1 System Power-Up and Power-Down Sequence

Although the DLPC3432 requires an array of power supply voltages (for example, V_{DD} , V_{DDL12} , V_{DD_PLLMD} , V_{CC18} , V_{CC_FLSH} , V_{CC_INTF}), if V_{DDL12} is tied to the 1.1-V V_{DD} supply (which is assumed to be the typical configuration), then there are no restrictions regarding the relative order of power supply sequencing to avoid damaging the DLPC3432 (this is true for both power-up and power-down scenarios). Similarly, there is no minimum time between powering-up or powering-down the different supplies if V_{DDL12} is tied to the 1.1-V V_{DD} supply.

If, however, V_{DDL12} is not tied to the V_{DD} supply, then V_{DDL12} must be powered-on after the V_{DD} supply is powered-on, and powered-off before the V_{DD} supply is powered-off. In addition, if V_{DDL12} is not tied to V_{DD} , then V_{DDL12} and V_{DD} supplies should be powered on or powered off within 100 ms of each other.

Although there is no risk of damaging the DLPC3432 if the above power sequencing rules are followed, the following additional power sequencing recommendations must be considered to ensure proper system operation.

- To ensure that the DLPC3432 output signal states behave as expected, all DLPC3432 I/O supplies should remain applied while V_{DD} core power is applied. If V_{DD} core power is removed while the I/O supply (V_{CC_INTF}) is applied, then the output signal state associated with the inactive I/O supply will go to a high impedance state.
- Additional power sequencing rules may exist for devices that share the supplies with the DLPC3432, and thus these devices may force additional system power sequencing requirements.

Note that when the V_{DD} core power is applied, but the I/O power is not applied, additional leakage current may be drawn. This added leakage does not affect normal DLPC3432 operation or reliability.

[Figure 26](#) and [Figure 27](#) show the DLPC3432 power-up and power-down sequence for both the normal PARK and fast PARK operations of the DLPC3432 ASIC.

System Power-Up and Power-Down Sequence (continued)

Figure 26. DLPC3432 Power-Up / PROJ_ON = 0 Initiated Normal PARK and Power-Down

System Power-Up and Power-Down Sequence (continued)

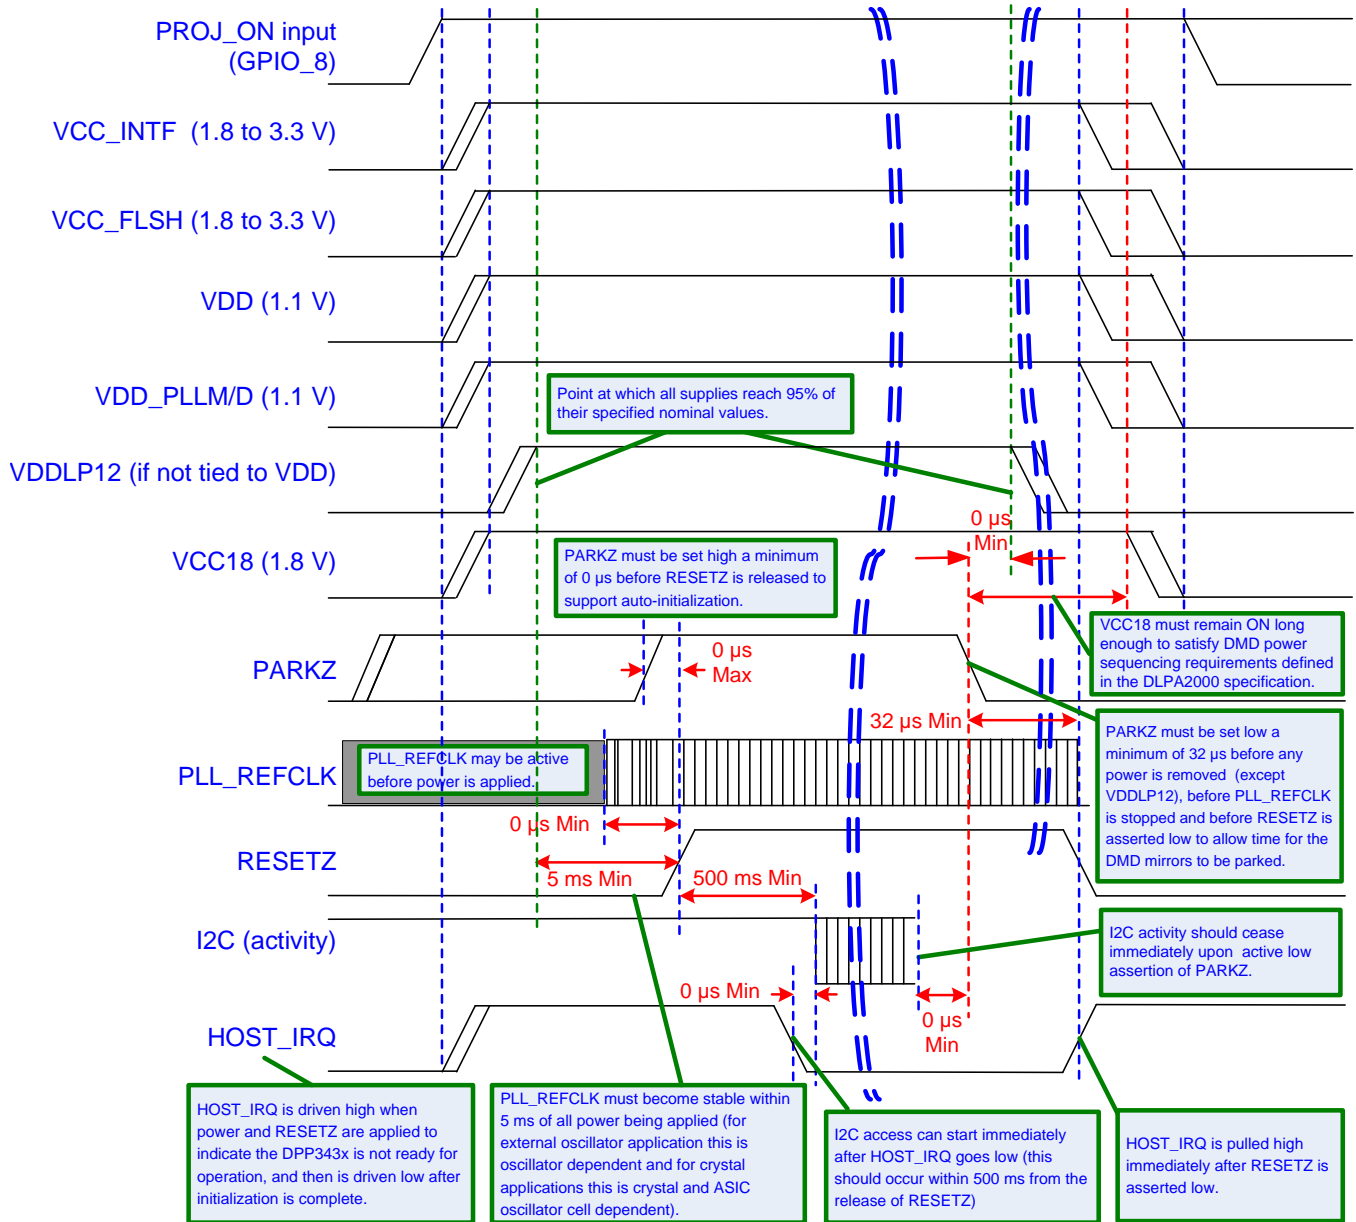

Figure 27. DLPC3432 Power-Up / PARKZ = 0 Initiated Fast PARK and Power-Down

10.2 DLPC3432 Power-Up Initialization Sequence

It is assumed that an external power monitor will hold the DLPC3432 in system reset during power-up. It must do this by driving RESETZ to a logic low state. It should continue to assert system reset until all ASIC voltages have reached the minimum specified voltage levels, PARKZ is asserted high, and input clocks are stable. During this time, most ASIC outputs will be driven to an inactive state and all bidirectional signals will be configured as inputs to avoid contention. ASIC outputs that are not driven to an inactive state are tri-stated. These include LED_SEL_0, LED_SEL_1, SPICLK, SPIDOUT, and SPICSZ0 (see the RESETZ pin description for a full description of signals in [Pin Configuration and Functions](#)). After power is stable and the PLL_REFCLK_I clock input to the DLPC3432 is stable, then RESETZ should be deactivated (set to a logic high). The DLPC3432 then performs a power-up initialization routine that first locks its PLL followed by loading self configuration data from the external flash. Upon release of RESETZ all DLPC3432 I/Os will become active. Immediately following the release of RESETZ, the HOST_IRQ signal will be driven high to indicate that the auto initialization routine is in progress. However, since a pullup resistor is connected to signal HOST_IRQ, this signal will have already gone high before the DLPC3432 actively drives it high. Upon completion of the auto-initialization routine, the DLPC3432 will drive HOST_IRQ low to indicate the initialization done state of the DLPC3432 has been reached.

Note that the host processor can start sending I²C commands after HOST_IRQ goes low.

10.3 DMD Fast PARK Control (PARKZ)

The PARKZ signal is defined as an early warning signal that should alert the ASIC 32 μ s before DC supply voltages have dropped below specifications in fast PARK operation. This allows the ASIC time to park the DMD, ensuring the integrity of future operation. Note that the reference clock should continue to run and RESETZ should remain deactivated for at least 32 μ s after PARKZ has been deactivated (set to a logic low) to allow the park operation to complete.

10.4 Hot Plug Usage

The DLPC3432 provides fail-safe I/O on all host interface signals (signals powered by V_{CC_INTF}). This allows these inputs to be driven high even when no I/O power is applied. Under this condition, the DLPC3432 will not load the input signal nor draw excessive current that could degrade ASIC reliability. For example, the I²C bus from the host to other components would not be affected by powering off V_{CC_INTF} to the DLPC3432. TI recommends weak pullups or pulldowns on signals feeding back to the host to avoid floating inputs.

If the I/O supply (V_{CC_INTF}) is powered off, but the core supply (V_{DD}) is powered on, then the corresponding input buffer may experience added leakage current, but this does not damage the DLPC3432.

10.5 Maximum Signal Transition Time

Unless otherwise noted, 10 ns is the maximum recommended 20% to 80% rise or fall time to avoid input buffer oscillation. This applies to all DLPC3432 input signals. However, the PARKZ input signal includes an additional small digital filter that ignores any input buffer transitions caused by a slower rise or fall time for up to 150 ns.

11 Layout

11.1 Layout Guidelines

11.1.1 PCB Layout Guidelines for Internal ASIC PLL Power

The following guidelines are recommended to achieve desired ASIC performance relative to the internal PLL. The DLPC3432 contains two internal PLLs which have dedicated analog supplies ($V_{DD_PLL M}$, $V_{SS_PLL M}$, $V_{DD_PLL D}$, $V_{SS_PLL D}$). As a minimum, $V_{DD_PLL X}$ power and $V_{SS_PLL X}$ ground pins should be isolated using a simple passive filter consisting of two series ferrites and two shunt capacitors (to widen the spectrum of noise absorption). It is recommended to use a 0.1- μF capacitor and a 0.01- μF capacitor. All four components should be placed as close to the ASIC as possible but it is especially important to keep the leads of the high frequency capacitors as short as possible. Note that both capacitors should be connected across $V_{DD_PLL M}$ and $V_{SS_PLL M}$ / $V_{DD_PLL D}$ and $V_{SS_PLL D}$ respectively on the ASIC side of the ferrites.

For the ferrite beads used, their respective characteristics should be as follows:

- DC resistance less than 0.40 Ω
- Impedance at 10 MHz equal to or greater than 180 Ω
- Impedance at 100 MHz equal to or greater than 600 Ω

The PCB layout is critical to PLL performance. It is vital that the quiet ground and power are treated like analog signals. Therefore, $V_{DD_PLL M}$ and $V_{DD_PLL D}$ must be a single trace from the DLPC3432 to both capacitors and then through the series ferrites to the power source. The power and ground traces should be as short as possible, parallel to each other, and as close as possible to each other.

Figure 28. PLL Filter Layout

Layout Guidelines (continued)

11.1.2 DLPC3432 Reference Clock

The DLPC3432 requires an external reference clock to feed its internal PLL. A crystal or oscillator can supply this reference. For flexibility, the DLPC3432 accepts either of two reference clock frequencies (see [Table 10](#)), but both must have a maximum frequency variation of ± 200 ppm (including aging, temperature, and trim component variation). When a crystal is used, several discrete components are also required as shown in [Figure 29](#).

- A. C_L = Crystal load capacitance (Farads)
- B. $C_{L1} = 2 \times (C_L - C_{\text{stray_pll_refclk_i}})$
- C. $C_{L2} = 2 \times (C_L - C_{\text{stray_pll_refclk_o}})$
- D. Where:
 - $C_{\text{stray_pll_refclk_i}}$ = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin pll_refclk_i.
 - $C_{\text{stray_pll_refclk_o}}$ = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin pll_refclk_o.

Figure 29. Required Discrete Components

11.1.2.1 Recommended Crystal Oscillator Configuration

Table 9. Crystal Port Characteristics

PARAMETER	NOM	UNIT
PLL_REFCLK_I TO GND capacitance	1.5	pF
PLL_REFCLK_O TO GND capacitance	1.5	pF

Table 10. Recommended Crystal Configuration⁽¹⁾⁽²⁾

PARAMETER	RECOMMENDED	UNIT
Crystal circuit configuration	Parallel resonant	
Crystal type	Fundamental (first harmonic)	
Crystal nominal frequency	24	MHz
Crystal frequency tolerance (including accuracy, temperature, aging, and trim sensitivity)	± 200	PPM
Maximum start-up time	1.0	ms
Crystal equivalent series resistance (ESR)	120 maximum	Ω
Crystal load	6	pF
RS drive resistor (nominal)	100	Ω
RFB feedback resistor (nominal)	1	M Ω
CL1 external crystal load capacitor	See equation in Figure 29 notes	pF
CL2 external crystal load capacitor	See equation in Figure 29 notes	pF
PCB layout	A ground isolation ring around the crystal is recommended	

(1) Temperature range of -30°C to 85°C .

(2) The crystal bias is determined by the ASIC's V_{CC_INTF} voltage rail, which is variable (not the V_{CC18} rail).

If an external oscillator is used, then the oscillator output must drive the PLL_REFCLK_I pin on the DLPC3432 ASIC and the PLL_REFCLK_O pins should be left unconnected.

Table 11. DLPC3432 Recommended Crystal Parts⁽¹⁾⁽²⁾⁽³⁾

PASSED DVT	MANUFACTURER	PART NUMBER	SPEED	TEMPERATURE AND AGING	ESR	LOAD CAPACITANCE
Yes	KDS	DSX211G-24.000M-8pF-50-50	24 MHz	±50 ppm	120-Ω max	8 pF
Yes	Murata	XRCGB24M000F0L11R0	24 MHz	±100 ppm	120-Ω max	6 pF
Yes	NDK	NX2016SA 24M EXS00A-CS05733	24 MHz	±145 ppm	120-Ω max	6 pF

(1) These crystal devices appear compatible with the DLPC3432, but only those marked with yes in the DVT column have been validated.

(2) Crystal package sizes: 2.0 mm × 1.6 mm for all crystals.

(3) Operating temperature range: –30°C to 85°C for all crystals.

11.1.2.2 PCB Layout Guidelines for DSI Interface

The DSI LVDS interface should follow the following PCB layout guidelines to ensure proper DSI operation:

- The differential clock and data lines should be routed to match 50 Ohm single-ended and 100 Ohm differential impedance.
- The length of each DDxN and DDxP pair, and the DCLKN and DCLKP pair should be matched. If that is not possible, then the DDxP should be slightly longer than the DDxN line, and especially the DCLKP should be slightly longer than the DCLKP line (delta delay not to exceed 8-10ps). This is to prevent propagation of the clock lane during high speed to low speed transition.
- No thru-hole VIAS permitted on high speed traces.
- Route preferably on top or bottom layers.
- Must have a ground reference plane.
- Avoid power plane transitions in upper or lower layers.
- Avoid using larger than 0402 SMS resistors if required. If 0402 resistors are used in the traces then the layer below must have a void.
- No thru-hole SMA connectors.
- Minimize trace length as possible.
- Perform signal integrity simulations to ensure board performance.

11.1.3 General PCB Recommendations

TI recommends 1-oz. copper planes in the PCB design to achieve needed thermal connectivity.

11.1.4 General Handling Guidelines for Unused CMOS-Type Pins

To avoid potentially damaging current caused by floating CMOS input-only pins, TI recommends that unused ASIC input pins be tied through a pullup resistor to its associated power supply or a pulldown to ground. For ASIC inputs with internal pullup or pulldown resistors, it is unnecessary to add an external pullup or pulldown unless specifically recommended. Note that internal pullup and pulldown resistors are weak and should not be expected to drive the external line. The DLPC3432 implements very few internal resistors and these are noted in the pin list. When external pullup or pulldown resistors are needed for pins that have built-in weak pullups or pulldowns, use the value 8 kΩ (maximum).

Unused output-only pins should never be tied directly to power or ground, but can be left open.

When possible, TI recommends that unused bidirectional I/O pins be configured to their output state such that the pin can be left open. If this control is not available and the pins may become an input, then they should be pulled-up (or pulled-down) using an appropriate, dedicated resistor.

11.1.5 Maximum Pin-to-Pin, PCB Interconnects Etch Lengths
Table 12. Maximum Pin-to-Pin PCB Interconnect Recommendations⁽¹⁾⁽²⁾

DMD BUS SIGNAL	SIGNAL INTERCONNECT TOPOLOGY		UNIT
	SINGLE BOARD SIGNAL ROUTING LENGTH	MULTI-BOARD SIGNAL ROUTING LENGTH	
DMD_HS_CLK_P DMD_HS_CLK_N	6.0 152.4	See ⁽³⁾	inch (mm)
DMD_HS_WDATA_A_P DMD_HS_WDATA_A_N	6.0 152.4	See ⁽³⁾	inch (mm)
DMD_HS_WDATA_B_P DMD_HS_WDATA_B_N			
DMD_HS_WDATA_C_P DMD_HS_WDATA_C_N			
DMD_HS_WDATA_D_P DMD_HS_WDATA_D_N			
DMD_HS_WDATA_E_P DMD_HS_WDATA_E_N			
DMD_HS_WDATA_F_P DMD_HS_WDATA_F_N			
DMD_HS_WDATA_G_P DMD_HS_WDATA_G_N			
DMD_HS_WDATA_H_P DMD_HS_WDATA_H_N			
DMD_LS_CLK			
DMD_LS_WDATA	6.5 165.1	See ⁽³⁾	inch (mm)
DMD_LS_RDATA	6.5 165.1	See ⁽³⁾	inch (mm)
DMD_DEN_ARSTZ	7.0 177.8	See ⁽³⁾	inch (mm)

(1) Maximum signal routing length includes escape routing.

(2) Multi-board DMD routing length is more restricted due to the impact of the connector.

(3) Due to board variations, these are impossible to define. Any board designs should be simulated in SPICE with ASIC IBIS models to ensure single routing lengths do not exceed requirements.

Table 13. High Speed PCB Signal Routing Matching Requirements⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

SIGNAL GROUP LENGTH MATCHING				
INTERFACE	SIGNAL GROUP	REFERENCE SIGNAL	MAXIMUM MISMATCH ⁽⁵⁾	UNIT
DMD	DMD_HS_WDATA_A_P DMD_HS_WDATA_A_N	DMD_HS_CLK_P DMD_HS_CLK_N	±0.1 (±25.4)	inch (mm)
	DMD_HS_WDATA_B_P DMD_HS_WDATA_B_N			
	DMD_HS_WDATA_C_P DMD_HS_WDATA_C_N			
	DMD_HS_WDATA_D_P DMD_HS_WDATA_D_N			
	DMD_HS_WDATA_E_P DMD_HS_WDATA_E_N			
	DMD_HS_WDATA_F_P DMD_HS_WDATA_F_N			
	DMD_HS_WDATA_G_P DMD_HS_WDATA_G_N			
	DMD_HS_WDATA_H_P DMD_HS_WDATA_H_N			
DMD	DMD_LS_WDATA DMD_LS_RDATA	DMD_LS_CLK	±0.2 (±5.08)	inch (mm)
DMD	DMD_DEN_ARSTZ	N/A	N/A	inch (mm)

- (1) These values apply to PCB routing only. They do not include any internal package routing mismatch associated with the DLPC3432, the DMD.
- (2) DMD high speed data lines are differential, thus these specifications are pair-to-pair.
- (3) Training is applied to DMD high speed data lines, so defined matching requirements are slightly relaxed.
- (4) DMD low speed signals are single ended.
- (5) Mismatch variance applies to high-speed data pairs. For all high-speed data pairs, the maximum mismatch between pairs should be 1 mm or less.

11.1.6 Number of Layer Changes

- Single-ended signals: Minimize the number of layer changes.
- Differential signals: Individual differential pairs can be routed on different layers, but the signals of a given pair should not change layers.

11.1.7 Stubs

- Stubs should be avoided.

11.1.8 Terminations

- No external termination resistors are required on DMD_HS differential signals.
- The DMD_LS_CLK and DMD_LS_WDATA signal paths should include a 43-Ω series termination resistor located as close as possible to the corresponding ASIC pins.
- The DMD_LS_RDATA signal path should include a 43-Ω series termination resistor located as close as possible to the corresponding DMD pin.
- DMD_DEN_ARSTZ does not require a series resistor.

11.1.9 Routing Vias

- The number of vias on DMD_HS signals should be minimized and should not exceed two.
- Any and all vias on DMD_HS signals should be located as close to the ASIC as possible.
- The number of vias on the DMD_LS_CLK and DMD_LS_WDATA signals should be minimized and not exceed two.
- Any and all vias on the DMD_LS_CLK and DMD_LS_WDATA signals should be located as close to the ASIC as possible.

11.1.10 Thermal Considerations

The underlying thermal limitation for the DLPC3432 is that the maximum operating junction temperature (T_J) should not be exceeded (this is defined in the [Recommended Operating Conditions](#)). This temperature is dependent on operating ambient temperature, airflow, PCB design (including the component layout density and the amount of copper used), power dissipation of the DLPC3432, and power dissipation of surrounding components. The DLPC3432's package is designed primarily to extract heat through the power and ground planes of the PCB. Thus, copper content and airflow over the PCB are important factors.

The recommended maximum operating ambient temperature (T_A) is provided primarily as a design target and is based on maximum DLPC3432 power dissipation and $R_{\theta JA}$ at 0 m/s of forced airflow, where $R_{\theta JA}$ is the thermal resistance of the package as measured using a glater test PCB with two, 1-oz power planes. This JEDEC test PCB is not necessarily representative of the DLPC3432 PCB; the reported thermal resistance may not be accurate in the actual product application. Although the actual thermal resistance may be different, it is the best information available during the design phase to estimate thermal performance. However, after the PCB is designed and the product is built, TI highly recommends that thermal performance is measured and validated.

To do this, measure the top center case temperature under the worst case product scenario (maximum power dissipation, maximum voltage, maximum ambient temperature) and validate that this value does not exceed the maximum recommended case temperature (T_C). This specification is based on the measured ϕ_{JT} for the DLPC3432 package and provides a relatively accurate correlation to junction temperature. Take care when measuring this case temperature to prevent accidental cooling of the package surface. TI recommends a small (approximately 40 gauge) thermocouple. The bead and thermocouple wire should contact the top of the package and be covered with a minimal amount of thermally conductive epoxy. The wires should be routed closely along the package and the board surface to avoid cooling the bead through the wires.

11.2 Layout Example

Figure 30. Layout Recommendation

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.1.2 Device Nomenclature

12.1.2.1 Device Markings

Marking Definitions:

- Line 1: DLP[®] Device Name: DLPC343x where x is a "2" for this device
 SC: Solder ball composition
 e1: Indicates lead-free solder balls consisting of SnAgCu
 G8: Indicates lead-free solder balls consisting of tin-silver-copper (SnAgCu) with silver content less than or equal to 1.5% and that the mold compound meets TI's definition of green.
- Line 2: TI Part Number
 DLP[®] Device Name: DLPC343x where x is a "2" for this device
R corresponds to the TI device revision letter for example A, B, or C.
XXX corresponds to the device package designator.
- Line 3: XXXXXXXXXXXX-TT Manufacturer Part Number
- Line 4: LLLLLL.ZZZ Foundry lot code for semiconductor wafers and lead-free solder ball marking
 LLLLLL: Fab lot number
 ZZZ: Lot split number
- Line 5: PH YYWW ES: Package assembly information
 PH: Manufacturing site
 YYWW: Date code (YY = Year :: WW = Week)

Device Support (continued)
NOTE

1. Engineering prototype samples are marked with an **X** suffix appended to the TI part number. For example, 2512737-0001X.
2. See [Table 2](#), for DLPC343x resolutions on the DMD supported per part number.

12.1.3 Video Timing Parameter Definitions

Active Lines Per Frame (ALPF) Defines the number of lines in a frame containing displayable data: ALPF is a subset of the TLPF.

Active Pixels Per Line (APPL) Defines the number of pixel clocks in a line containing displayable data: APPL is a subset of the TPPL.

Horizontal Back Porch (HBP) Blanking Number of blank pixel clocks after horizontal sync but before the first active pixel. Note: HBP times are referenced to the leading (active) edge of the respective sync signal.

Horizontal Front Porch (HFP) Blanking Number of blank pixel clocks after the last active pixel but before Horizontal Sync.

Horizontal Sync (HS) Timing reference point that defines the start of each horizontal interval (line). The absolute reference point is defined by the active edge of the HS signal. The active edge (either rising or falling edge as defined by the source) is the reference from which all horizontal blanking parameters are measured.

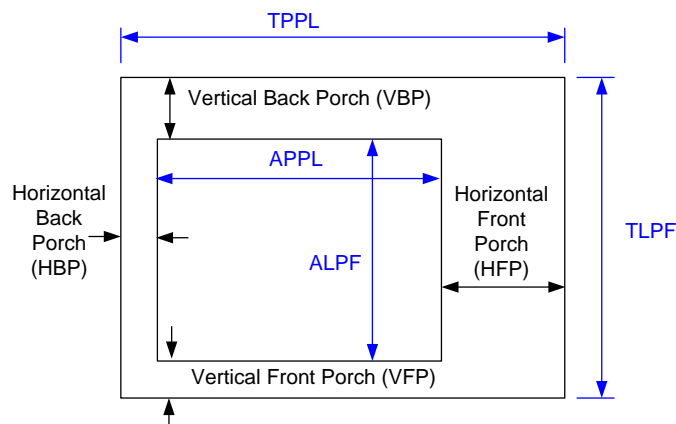

Total Lines Per Frame (TLPF) Defines the vertical period (or frame time) in lines: $TLPF = \text{Total number of lines per frame (active and inactive)}$.

Total Pixel Per Line (TPPL) Defines the horizontal line period in pixel clocks: $TPPL = \text{Total number of pixel clocks per line (active and inactive)}$.

Vertical Sync (VS) Timing reference point that defines the start of the vertical interval (frame). The absolute reference point is defined by the active edge of the VS signal. The active edge (either rising or falling edge as defined by the source) is the reference from which all vertical blanking parameters are measured.

Vertical Back Porch (VBP) Blanking Number of blank lines after the leading edge of vertical sync but before the first active line.

Vertical Front Porch (VFP) Blanking Number of blank lines after the last active line but before the leading edge of vertical sync.

12.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 Trademarks

IntelliBright, E2E are trademarks of Texas Instruments.

12.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLPC3432CZVB	ACTIVE	NFBGA	ZVB	176	260	TBD	Call TI	Call TI	0 to 70		Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. This package is Pb-free.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
