

## DRV8704 52-V Dual H-Bridge PWM Gate Driver

### 1 Features

- Pulse Width Modulation (PWM) Motor Driver
  - Drives External N-Channel MOSFETs
  - PWM Control Interface for Dual DC Motors
  - Supports 100% PWM Duty Cycle
- 8-V to 52-V Operating Supply Voltage Range
- Adjustable Gate Drive (4 Levels)
  - 50-mA to 200-mA Source Current
  - 100-mA to 400-mA Sink Current
- Integrated PWM Current Regulation
- Flexible Decay Modes
  - Automatic Mixed Decay Mode
  - Slow Decay
  - Fast Decay
  - Mixed Decay (Adjustable Percent Fast)
- Highly Configurable SPI
- Torque DAC to Digitally Scale Current
- Low-Current Sleep Mode (65  $\mu$ A)
- 5-V, 10-mA LDO Regulator
- Thermally-Enhanced Surface-Mount Package
  - 38-Pin HTSSOP (PowerPAD)
- Protection Features
  - VM Undervoltage Lockout (UVLO)
  - Gate Driver Fault (PDF)
  - Overcurrent Protection (OCP)
  - Thermal Shutdown (TSD)
  - Fault Condition Indication Pin (nFAULT)
  - Fault Diagnostics through SPI

### 2 Applications

- Automatic Teller and Money Handling Machines
- Office Automation Machines
- Factory Automation and Robotics
- Textile Machines

### 3 Description

The DRV8704 is a dual-brushed motor controller for industrial equipment applications. The device controls external N-channel MOSFETs configured as two H-bridges.

Motor current can be accurately controlled using adaptive blanking time and various current decay modes, including an automatic mixed decay mode.

A simple PWM interface allows easy interfacing to controller circuits. A SPI serial interface is used to program the device operation. Output current (torque), gate drive settings, and decay mode are all programmable through a SPI serial interface.

Internal shutdown functions are provided for overcurrent protection, short-circuit protection, gate driver faults, undervoltage lockout (UVLO), and overtemperature. Fault conditions are indicated by a FAULTn pin, and each fault condition is reported by a dedicated bit through SPI.

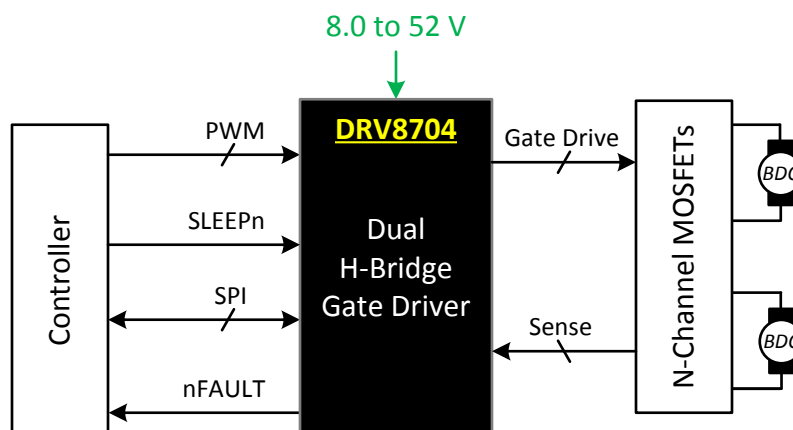

The DRV8704 is packaged in a PowerPAD™ 38-pin HTSSOP package with thermal pad (Eco-friendly: RoHS & no Sb/Br).

#### Device Information <sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8704	HTSSOP (38)	9.70 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

### Pin Functions

PIN <sup>(1)</sup>		TYPE	DESCRIPTION	
NAME	NO.			
<b>POWER AND GROUND</b>				
CP1	1	IO	Charge pump flying capacitor	Connect a 0.1- $\mu$ F X7R capacitor between CP1 and CP2. Voltage rating must be greater than applied VM voltage.
CP2	2	IO	Charge pump flying capacitor	
GND	5, 19, 29, 38, PPAD	—	Device ground	All pins must be connected to ground
RSVD	20	—	Reserved	Leave this pin disconnected
V5	6	O	5-V regulator output	5-V linear regulator output. Bypass to GND with a 0.1- $\mu$ F 10-V X7R ceramic capacitor.
VCP	3	IO	High-side gate drive voltage	Connect a 1- $\mu$ F 16-V X7R ceramic capacitor to VM
VINT	7	—	Internal logic supply voltage	Logic supply voltage. Bypass to GND with a 1- $\mu$ F 6.3-V X7R ceramic capacitor.
VM	4	—	Motor power supply	Connect to motor supply voltage. Bypass to GND with a 0.1- $\mu$ F ceramic capacitor plus a 100- $\mu$ F electrolytic capacitor.
<b>CONTROL</b>				
AIN1	10	I	Bridge A IN1	Controls bridge A OUT1. Internal pulldown.
AIN2	11	I	Bridge A IN2	Controls bridge A OUT2. Internal pulldown.
BIN1	12	I	Bridge B IN1	Controls bridge B OUT1. Internal pulldown.
BIN2	13	I	Bridge B IN2	Controls bridge B OUT2. Internal pulldown.
RESET	9	I	Reset input	Active-high reset input initializes all internal logic and disables the H-bridge outputs. Internal pulldown.
SLEEPn	8	I	Sleep mode input	Logic high to enable device, logic low to enter low-power sleep mode. Internal pulldown.
<b>SERIAL INTERFACE</b>				
SCLK	14	I	Serial clock input	Rising edge clocks data into part for write operations. Falling edge clocks data out of part for read operations. Internal pulldown.
SCS	16	I	Serial chip select input	Active high to enable serial data transfer. Internal pulldown.
SDATI	15	I	Serial data input	Serial data input from controller. Internal pulldown.

(1) Directions: I = Input, O = Output, OZ = Tri-state output, OD = Open-drain output, IO = Input/output

**Pin Functions (continued)**

PIN <sup>(1)</sup>		TYPE	DESCRIPTION	
NAME	NO.			
SDATO	17	O	Serial data output	Serial data output to controller. Open-drain output requires external pull-up.
<b>STATUS</b>				
FAULTn	18	OD	Fault	Logic low when in fault condition. Open-drain output requires external pullup.
<b>OUTPUT</b>				
A1HS	36	O	Bridge A out 1 HS gate	Bridge A out 1 HS FET gate
A1LS	35	O	Bridge A out 1 LS gate	Bridge A out 1 LS FET gate
A2HS	31	O	Bridge A out 2 HS gate	Bridge A out 2 HS FET gate
A2LS	32	O	Bridge A out 2 LS gate	Bridge A out 2 LS FET gate
AISENN	33	I	Bridge A Isense – in	Ground at sense resistor for bridge A
AISENP	34	I	Bridge A Isense + in	Current sense resistor for bridge A
AOUT1	37	I	Bridge A output 1	Output node of bridge A out 1
AOUT2	30	I	Bridge A output 2	Output node of bridge A out 2
B1HS	27	O	Bridge B out 1 HS gate	Bridge B out 1 HS FET gate
B1LS	26	O	Bridge B out 1 LS gate	Bridge B out 1 LS FET gate
B2HS	22	O	Bridge B out 2 HS gate	Bridge B out 2 HS FET gate
B2LS	23	O	Bridge B out 2 LS gate	Bridge B out 2 LS FET gate
BISENN	24	I	Bridge B Isense – in	Ground at sense resistor for bridge B
BISENP	25	I	Bridge B Isense + in	Current sense resistor for bridge B
BOUT1	28	I	Bridge B output 1	Output node of bridge B out 1
BOUT2	21	I	Bridge B output 2	Output node of bridge B out 2

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range referenced with respect to GND (unless otherwise noted) <sup>(1)</sup>

	MIN	MAX	UNIT
Power supply voltage (VM)	-0.6	60	V
Charge pump voltage (CP1, CP2, VCP)	-0.6	VM + 12	V
5-V regulator voltage (V5)	-0.6	5.5	V
Internal regulator voltage (VINT)	-0.6	2.0	V
Digital pin voltage (SLEEPn, RESET, AIN1, AIN2, BIN1, BIN2, SCS, SCLK, SDATI, SDATO, FAULTn)	-0.6	5.5	V
High-side gate drive pin voltage (A1HS, A2HS, B1HS, B2HS)	-0.6	VM + 12	V
Low-side gate drive pin voltage (A1LS, A2LS, B1LS, B2LS)	-0.6	12	V
Phase node pin voltage (AOUT1, AOUT2, BOUT1, BOUT2)	-0.6	VM	V
ISENSEx pin voltage (AISENP, AISENN, BISENP, BISENN)	-0.7	+0.7	V
Operating virtual junction temperature, T <sub>J</sub>	-40	150	°C
Storage temperature, T <sub>stg</sub>	-60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500
			V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
VM	Motor power supply voltage range	8	52	V
V <sub>IN</sub>	Digital pin voltage range	0	5.3	V
f <sub>PWM</sub>	Applied PWM signal (xINx)	0	500	kHz
I <sub>V5</sub>	V5 external load current	0	10	mA
T <sub>A</sub>	Operating ambient temperature range	-40	85	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV8704	UNIT
		DCP (HTSSOP)	
		38 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	32.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	17.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	14.3	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.5	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	14.1	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	0.9	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

 $T_A = 25^\circ\text{C}$ , over recommended operating conditions unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLIES (VM)</b>						
$I_{VM}$	VM operating supply current	VM = 24 V		17	22	mA
$I_{VMQ}$	VM sleep mode supply current	VM = 24 V, SLEEPn low		65	98	$\mu\text{A}$
<b>INTERNAL LINEAR REGULATORS (V5, VINT)</b>						
V5	V5 output voltage	VM $\geq$ 12 V, IOUT $\leq$ 10 mA	4.8	5	5.2	V

## 7 Detailed Description

### 7.1 Overview

The DRV8704 is a dual-brushed motor controller that uses external N-channel MOSFETs to drive two brushed DC motors.

Motor current can be accurately controlled using adaptive blanking time and various current decay modes, including an auto-mixed decay mode.

A simple PWM interface allows easy interfacing to controller circuits. A SPI serial interface is used to program the device operation. Output current (torque), gate drive settings, and decay mode are all programmable through a SPI serial interface.

Internal shutdown functions are provided for overcurrent protection, short-circuit protection, UVLO, and overtemperature. Fault conditions are indicated by a FAULTn pin, and each fault condition is reported by a dedicated bit through SPI.

## 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 PWM Motor Drivers

The DRV8704 contains two H-bridge motor gate drivers with current-control PWM circuitry.

#### 7.3.2 Direct PWM Input Mode (Dual Brushed DC Gate Driver)

In direct PWM input mode, the AIN1, AIN2, BIN1, and BIN2 directly control the state of the output drivers. This allows for driving up to two brushed DC motors. [Table 1](#) shows the logic.

**Table 1. Output Control Logic Table**

SLEEPn	xIN1	xIN2	xOUT1	xOUT2	DESCRIPTION
0	X	X	Hi-Z	Hi-Z	Sleep mode; H-bridge disabled Hi-Z
1	0	0	Hi-Z	Hi-Z	Coast; H-bridge disabled Hi-Z
1	0	1	L	H	Reverse (current xOUT2 → xOUT1)
1	1	0	H	L	Forward (current xOUT1 → xOUT2)
1	1	1	L	L	Brake; low-side slow decay

In direct PWM mode, the current control circuitry is still active. The full-scale VREF is set to 2.75 V. The TORQUE register may be used to scale this value, and the ISEN sense amplifier gain may still be set using the ISGAIN bits of the CTRL register.

**Figure 8. Motor Driver Block Diagram**

### 7.3.3 Current Regulation

The current through the motor windings is regulated by an adjustable fixed-off-time PWM current regulation circuit. When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage and inductance of the winding and the magnitude of the back EMF present. Once the current hits the current chopping threshold, the bridge disables the current for a fixed period of time, which is programmable between 525 ns and 128  $\mu$ s by writing to the TOFF bits in the OFF register. After the off time expires, the bridge is re-enabled, starting another PWM cycle.

Note that the decay mode is set by DECMOD bits in the DECAY register. Slow, fast, mixed, or auto mixed decay modes are available.

The chopping current is set by a comparator which compares the voltage across a current sense resistor connected to the xISENx pins, multiplied by the gain of the current sense amplifier, with a reference voltage. The current sense amplifier is programmable in the CTRL register.

When driving in PWM mode, the chopping current is calculated as follows:

$$I_{\text{CHOP}} = \frac{2.75 \text{ V} \times \text{TORQUE}}{256 \times \text{ISGAIN} \times R_{\text{ISENSE}}}$$

where

- TORQUE is the setting of the TORQUE bits
- ISGAIN is the programmed gain of the ISENSE amplifiers (5, 10, 20, or 40). (1)

### 7.3.4 Decay Modes

During PWM current chopping, the H-bridge is enabled to drive current through the motor winding until the PWM current chopping threshold is reached. This is shown in the diagram below as case 1. The current flow direction shown indicates positive current flow in the step table below.

Once the chopping current threshold is reached, the H-bridge can operate in two different states, fast decay or slow decay.

In fast decay mode, once the PWM chopping current level has been reached, the H-bridge reverses state to allow winding current to flow in a reverse direction. If the winding current approaches zero, the bridge is disabled to prevent any reverse current flow. Fast decay mode is shown in the diagram below as case 2.

In slow decay mode, winding current is recirculated by enabling both of the low-side FETs in the bridge. This is shown as case 3 in [Figure 9](#).

Figure 9. Decay Mode Current

Figure 10. Decay Mode Comparison

The DRV8704 supports fast decay and slow decay modes. In addition it supports fixed mixed decay and auto mixed decay modes. Decay mode is selected by the DECMOD bits in the DECAY register.

Mixed decay mode begins as fast decay, but after a programmable period of time (set by the TDECAY bits in the DECAY register) switches to slow decay mode for the remainder of the fixed off time.

Auto mixed decay mode samples the current level at the end of the blanking time, and if the current is above the  $I_{trip}$  threshold, immediately changes the H-bridge to fast decay. During fast decay, the (negative) current is monitored, and when it falls below the  $I_{trip}$  threshold (and another blanking time has passed), the bridge is switched to slow decay. Once the fixed off time expires, a new cycle is started.

If the bridge is turned on and at the end of  $t_{BLANK}$  the current is below the  $I_{trip}$  threshold, the bridge remains on until the current reaches  $I_{trip}$ . Then slow decay is entered for the fixed off time, and a new cycle begins.

Refer to [Figure 11](#).

The upper waveform shows the behavior if  $I < I_{trip}$  at the end of  $t_{BLANK}$ . This is a stable, slow decay mode of operation.

The lower waveform shows what happens when  $I > I_{trip}$  at the end of  $t_{BLANK}$ . Note that (at slow motor speeds, where back EMF is not significant), the current increase during the ON phase is the same magnitude as the current decrease in fast decay, since both times are controlled by  $t_{BLANK}$ , and the rate of change is the same (full VM is applied to the load inductance in both cases, but in opposite directions). In this case, the current will gradually be driven down until the peak current is just hitting  $I_{trip}$  at the end of the blanking time, after which some cycles will be slow decay, and some will be mixed decay.

Figure 11. Auto Mixed Decay

To accurately detect zero current, an internal offset has been intentionally placed in the zero current detection circuit. If an external filter is placed on the current sense resistor to the xISENN and xISENP pins, symmetry must be maintained. This means that any resistance between the bottom of the R<sub>ISENSE</sub> resistor and xISENN must be matched by the same resistor value (1% tolerance) between the top of the R<sub>ISENSE</sub> resistor and xISENP. Ensure a maximum resistance of 500 Ω. The capacitor value should be chosen such that the RC time constant is between 50 and 60 ns. Any external filtering on these pins is optional and not required for operation.

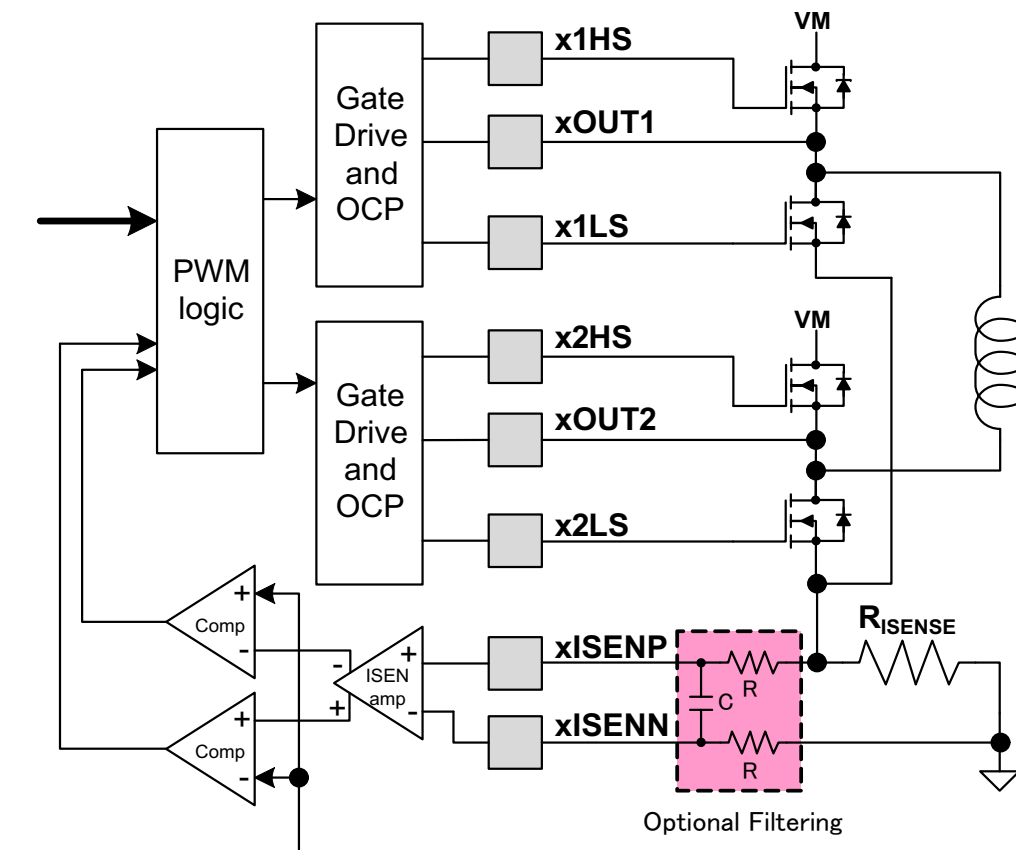

Figure 12. Optional Filtering for Sense Amplifiers

### 7.3.5 Blanking Time

After the current is enabled in an H-bridge, the voltage on the ISEN pin is ignored for a period of time before enabling the current sense circuitry. This blanking time is adjustable from 500 ns to 5.14  $\mu$ s, in 20-ns increments, by setting the TBLANK bits in the BLANK register. Note that the blanking time also sets the minimum drive time of the PWM.

The same blanking time is applied to the fast decay period in auto mixed decay mode. The PWM will ignore any transitions on Itrip after entering fast decay mode, until the blanking time has expired.

### 7.3.6 Gate Drivers

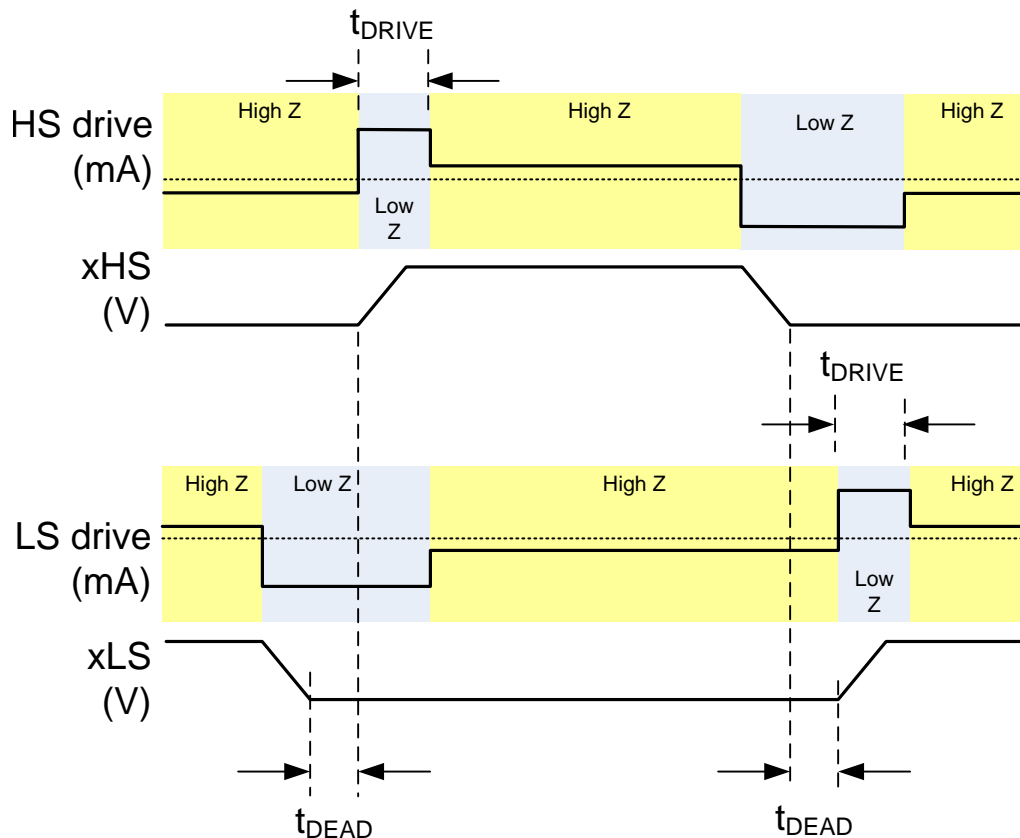

An internal charge pump circuit and pre-drivers inside the DRV8704 directly drive N-channel MOSFETs, which drive the motor current.

The peak drive current of the pre-drivers is adjustable by setting the bits in the DRIVE register. Peak source currents may be set to 50 mA, 100 mA, 150 mA, or 200 mA. The peak sink current is approximately 2 $\times$  the peak source current. Adjusting the peak current will change the output slew rate, which also depends on the FET input capacitance and gate charge.

When changing the state of the output, the peak current is applied for a short period of time ( $t_{DRIVE}$ ), to charge the gate capacitance. After this time, a weak current source is used to keep the gate at the desired state. When selecting the gate drive strength for a given external FET, the selected current must be high enough to fully charge and discharge the gate during the time when driven at full current, or excessive power will be dissipated in the FET.

During high-side turn-on, the low-side gate is pulled low. This prevents the gate-drain capacitance of the low-side FET from inducing turn-on.

The pre-driver circuits include enforcement of a dead time in analog circuitry, which prevents the high-side and low-side FETs from conducting at the same time. Additional dead time is added with digital delays. This delay can be selected by setting the DTIME bits in the CTRL register.

**Figure 13. Gate Driver**

Figure 14. Gate Driver Source Capability

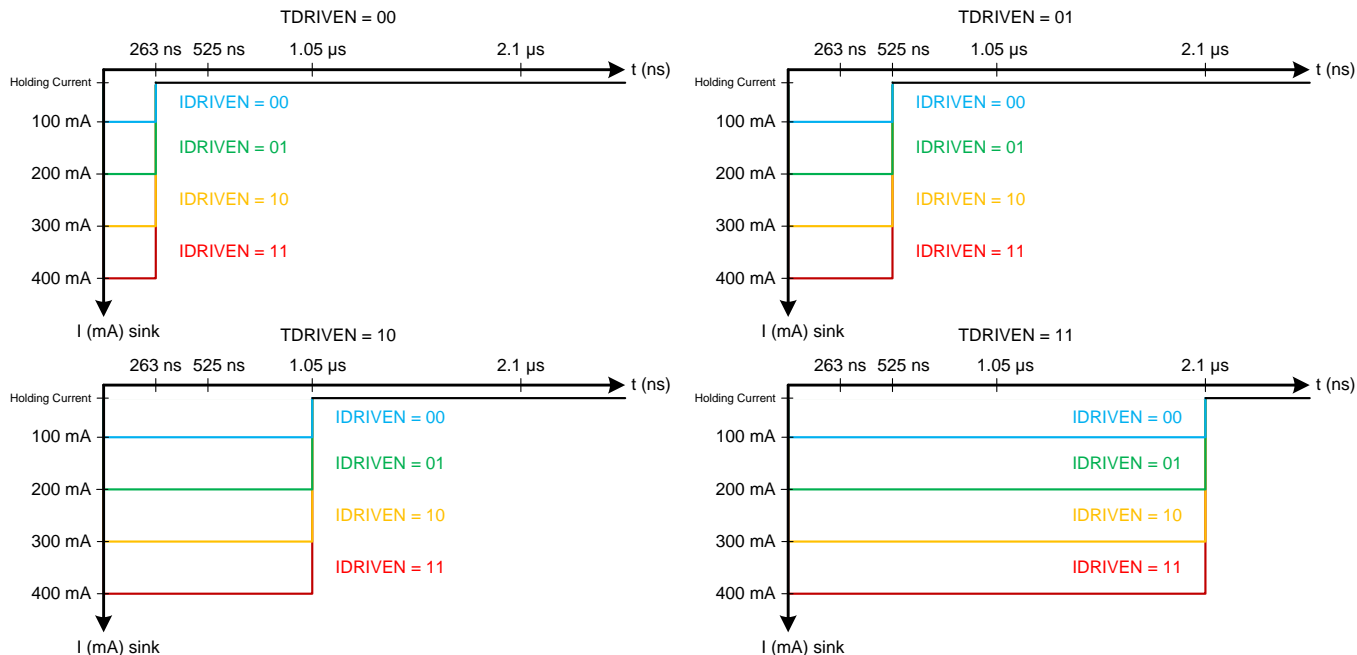

Figure 15. Gate Driver Sink Capability

### 7.3.7 Configuring Gate Drivers

IDRIVE and TDRIVE are selected based on the size of external FETs used. These registers need to be configured so that the FET gates are charged completely during TDRIVE. If IDRIVE and TDRIVE are chosen to be too low for a given FET, then the FET may not turn on completely. It is suggested to adjust these values in-system with the required external FETs and motors in order to determine the best possible setting for any application.

Note that TDRIVE will not increase the PWM time or change the PWM chopping frequency.

In a system with capacitor charge Q and desired rise time RT, IDRIVE, and TDRIVE can be initially selected based on:

$$\text{IDRIVE} > \frac{Q}{RT} \quad (2)$$

$$\text{TDRIVE} > 2 \times RT \quad (3)$$

For best results, select the smallest IDRIVE and TDRIVE that meet the above conditions.

Example:

If the gate charge is 15 nC and the desired rise time is 400 ns, then select

IDRIVEP = 50 mA, IDRIVEN = 100 mA

TDRIVEP = TDRIVEN = 1050 ns

### 7.3.8 External FET Selection

In a typical setup, the DRV8704 can support external FETs over 50 nC each. However, this capacity can be lower or higher based on the device operation. For an accurate calculation of FET driving capacity, use [Equation 4](#).

$$Q < \frac{20 \text{ mA} \times (2 \times \text{DTIME} + \text{TBLANK} + \text{TOFF})}{4} \quad (4)$$

Example:

If a DTIME is set to 0 (410 ns), TBLANK is set to 0 (1 μs), and TOFF is set to 0 (525 ns), then the DRV8704 will support Q < 11.5 nC FETs. (Please note that this is an absolute worst-case scenario with a PWM frequency about 430 kHz)

If a DTIME is set to 0 (410 ns), TBLANK is set to 0 (1 μs), and TOFF is set to 0x14 (10 μs), then the DRV8704 will support Q < 59 nC FETs (PWM frequency about 85 kHz).

If a DTIME is set to 0 (410 ns), TBLANK is set to 0 (1 μs), and TOFF is set to 0x60 (48 μs), then the DRV8704 will support Q < 249 nC FETs (PWM frequency about 20 kHz).

### 7.3.9 Protection Circuits

The DRV8704 is fully protected against undervoltage, overcurrent, and overtemperature events.

#### 7.3.9.1 Overcurrent Protection (OCP)

Overcurrent is sensed by monitoring the voltage drop across the external FETs. If the voltage across a driven FET exceeds the value programmed by the OCPH bits in the DRIVE register for more than the time period specified by the OCPDEG bits in the DRIVE register, an OCP event is recognized. During an OCP event, the H-bridge experiencing the OCP event is disabled. In addition, the corresponding xOCP bit in the STATUS register is set, and the FAULTn pin is driven low. The H-bridge (or H-bridges) will remain off, and the xOCP bit will remain set, until it is written to 0, or the device is reset.

#### 7.3.9.2 Gate Driver Fault (PDF)

If excessive current is detected on the gate drive outputs (which would be indicative of a failed/shorted output FET or PCB fault), the H-bridge experiencing the fault is disabled, the xPDF bit in the STATUS register is set, and the FAULTn pin is driven low. The H-bridge will remain off, and the xPDF bit will remain set until it is written to 0, or the device is reset.

#### 7.3.9.3 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge will be disabled, the OTS bit in the STATUS register will be set, and the FAULTn pin will be driven low. Once the die temperature has fallen to a safe level operation will automatically resume and the OTS bit will reset. The FAULTn pin will be released after operation has resumed.

### 7.3.9.4 Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage lockout threshold voltage, all FETs in the H-bridge will be disabled, the UVLO bit in the STATUS register will be set, and the FAULTn pin will be driven low. Operation will resume and the UVLO bit will reset when VM rises above the UVLO threshold. The FAULTn pin will be released after operation has resumed.

### 7.3.10 Serial Data Format

The serial data consists of a 16-bit serial write, with a read/write bit, 3 address bits and 12 data bits. The three address bits identify one of the registers defined in the register section above. To complete the read or write transaction, SCS must be set to a logic 0.

To write to a register, data is shifted in after the address as shown in the timing diagram below. The first bit at the beginning of the access must be logic low for a write operation.

Figure 16. Serial Write Operation

Data may be read from the registers through the SDATO pin. During a read operation, only the address is used from the SDATI pin; the data bits following are ignored. The first bit at the beginning of the access must be logic high for a read operation.

(1) Any amount of time may pass between bits, as long as SCS stays active high. This allows two 8-bit writes to be used

Figure 17. Serial Read Operation

## 7.4 Device Functional Modes

The DRV8704 is active unless the nSLEEP pin is brought logic low. In sleep mode the charge pump is disabled, the H-bridge FETs are disabled Hi-Z, and the V5 regulator is disabled. The DRV8704 is brought out of sleep mode automatically if nSLEEP is brought logic high.

If a '0' is written to the ENBL bit, the H-bridge outputs are disabled, but the internal logic will still be active.

Table 2. Functional Modes

CONDITION		H-BRIDGE	CHARGE PUMP	SPI	V5
Operating	8 V < VM < 52 V nSLEEP pin = 1 ENBL bit = 1	Operating	Operating	Operating	Operating
Disabled	8 V < VM < 52 V nSLEEP pin = 1 ENBL bit = 0	Disabled	Operating	Operating	Operating
Sleep mode	8 V < VM < 52 V nSLEEP pin = 0	Disabled	Disabled	Disabled	Disabled
Fault encountered	Any fault condition met	Disabled	Depends on fault	Depends on fault	Depends on fault

## 7.5 Register Maps

### 7.5.1 Control Registers

The DRV8704 uses internal registers to control the operation of the motor. The registers are programmed by a serial SPI communications interface. At power-up or reset, the registers will be pre-loaded with default values as shown in [Table 3](#).

Following is a map of the DRV8704 registers:

**Table 3. DRV8704 Register Map**

NAME	11	10	9	8	7	6	5	4	3	2	1	0	ADDRESS HEX

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The DRV8704 is used in brushed DC motor control.

### 8.2 Typical Application

The following design procedure can be used to configure the DRV8704.

Figure 18. Dual Brushed-DC Motor Control

## Typical Application (continued)

### 8.2.1 Design Requirements

Table 12 shows design input parameters for system design.

**Table 12. Design Parameters**

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Supply voltage	VM	24 V
FET total gate charge <sup>(1)</sup>	Q <sub>g</sub>	41 nC (typically)
FET gate-to-drain charge <sup>(1)</sup>	Q <sub>gd</sub>	6.7 nC (typically)
Target FET gate rise time	RT	20 to 100 ns
Motor winding resistance	R <sub>L</sub>	400 mΩ
Motor winding inductance	L <sub>L</sub>	258 μH
Target chopping current	I <sub>CHOP</sub>	5.5 A

(1) FET part number is [CSD18540Q5B](#)

### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 External FET Selection

The DRV8704 FET support is based on the charge pump capacity and output PWM frequency. For a quick calculation of FET driving capacity, use the following equations when drive and brake (slow decay) are the primary modes of operation:

$$Q_g < \frac{I_{VCP}}{2 \times f_{PWM}}$$

where

- $f_{PWM}$  is the maximum desired PWM frequency to be applied to the DRV8704 inputs or the current chopping frequency, whichever is larger.
- $I_{VCP}$  is the charge pump capacity, which is 20 mA.

The factor of two arises because there are two H-bridges present.

The current chopping frequency is at most:

$$f_{PWM} < \frac{1}{t_{OFF} + t_{BLANK}} \quad (6)$$

Example:

If a system uses a maximum PWM frequency of 40 kHz, then the DRV8704 will support  $Q_g < 250$  nC FETs.

If the application will require a forced fast decay (or alternating between drive and reverse drive), the maximum FET driving capacity is given by:

$$Q_g < \frac{I_{VCP}}{4 \times f_{PWM}} \quad (7)$$

#### 8.2.2.2 IDRIVE Configuration

IDRIVE is selected based on the gate charge of the FETs. The IDRIVE<sub>x</sub> and TDRIVE<sub>x</sub> registers need to be configured so that the FET gates are charged completely during TDRIVE. If IDRIVE is chosen to be too low for a given FET, or if TDRIVE is less than the intended rise time, then the FET may not turn on completely. TI suggests to adjust these values in-system with the required external FETs and motor to determine the best possible setting for any application.

For FETs with a known gate-to-drain charge  $Q_{gd}$  and desired rise time RT, IDRIVE and TDRIVE can be selected based on:

$$IDRIVE > \frac{Q_{gd}}{RT} \quad (8)$$

$$TDRIVE > 2 \times RT \quad (9)$$

Example:

If the gate-to-drain charge is 5.9 nC, and the desired rise time is around 20 to 100 ns:

$$IDRIVE_1 = 6.7 \text{ nC} / 20 \text{ ns} = 335 \text{ mA}$$

$$IDRIVE_2 = 6.7 \text{ nC} / 100 \text{ ns} = 67 \text{ mA}$$

Select IDRIVE between 67 and 335 mA.

We select IDRIVEP as 200-mA source and IDRIVEP as 400-mA sink.

We select TDRIVEN and TDRIVEP as 525 ns.

### 8.2.2.3 Current Chopping Configuration

The chopping current is set based on the sense resistor value, shunt amplifier gain set by the ISGAIN register, and the TORQUE register setting. The following is used to calculate the current:

$$I_{\text{CHOP}} = \frac{2.75 \text{ V} \times \text{TORQUE}}{256 \times \text{ISGAIN} \times R_{\text{ISENSE}}} \quad (10)$$

Example:

If the desired chopping current is 5.5 A:

Set  $R_{\text{SENSE}} = 100 \text{ m}\Omega$ .

Set ISGAIN to the 5 V/V setting.

The TORQUE register can be (decimal) 255.

### 8.2.2.4 Decay Modes

The DRV8704 supports several different decay modes: slow decay, fast decay, mixed decay, and automatic mixed decay. The current through the motor windings is regulated using an adjustable fixed-time-off scheme. This means that after any drive phase, when a motor winding current has hit the current chopping threshold ( $I_{\text{TRIP}}$ ), the DRV8704 will place the winding in one of the decay modes for TOFF. After TOFF, a new drive phase starts.

### 8.2.2.5 Sense Resistor

For optimal performance, it is important for the sense resistor to be:

- Surface-mount
- Low inductance
- Rated for high enough power
- Placed closely to the motor driver

The power dissipated by the sense resistor equals  $I_{\text{RMS}}^2 \times R$ . For example, if peak motor current is 3 A, RMS motor current is 2 A, and a 0.05- $\Omega$  sense resistor is used, the resistor will dissipate  $2 \text{ A}^2 \times 0.05 \text{ }\Omega = 0.2 \text{ W}$ . The power quickly increases with higher current levels.

Resistors typically have a rated power within some ambient temperature range, along with a derated power curve for high ambient temperatures. When a PCB is shared with other components generating heat, margin should be added. It is always best to measure the actual sense resistor temperature in a final system, along with the power MOSFETs, as those are often the hottest components.

Because power resistors are larger and more expensive than standard resistors, it is common practice to use multiple standard resistors in parallel, between the sense node and ground. This distributes the current and heat dissipation.

### 8.2.3 Application Curves

## 9 Power Supply Recommendations

The DRV8704 is designed to operate from an input voltage supply (VM) range between 8 and 52 V. A 0.01- $\mu\text{F}$  ceramic capacitor rated for VM must be placed as close to the DRV8704 as possible. In addition, a bulk capacitor must be included on VM.

### 9.1 Bulk Capacitance

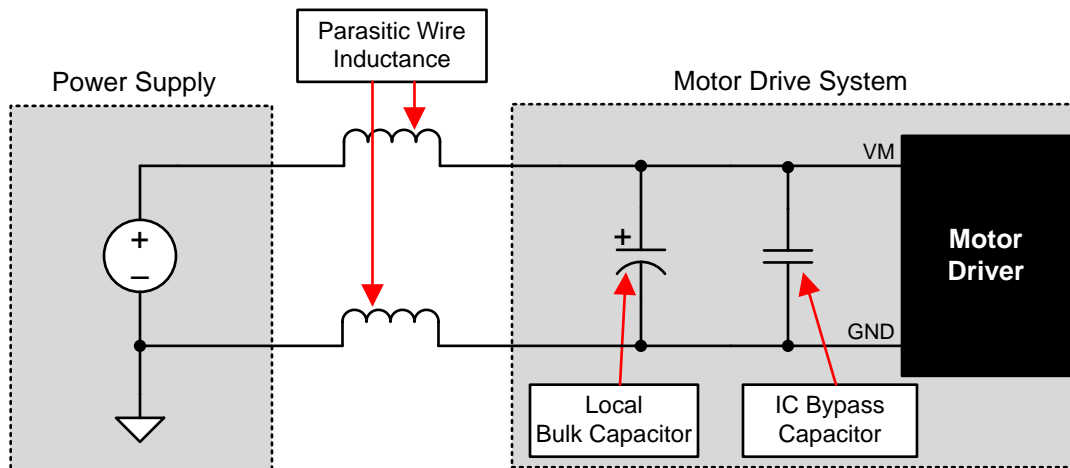

Having appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The power supply's capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

**Figure 21. Example Setup of Motor Drive System With External Power Supply**

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

## 10 Layout

### 10.1 Layout Guidelines

The VM terminal should be bypassed to GND using a low-ESR ceramic bypass capacitor with a recommended value of 0.01  $\mu\text{F}$  rated for VM. This capacitor should be placed as close to the VM pin as possible with a thick trace or ground plane connection to the device GND pin.

The VM pin must be bypassed to ground using a bulk capacitor rated for VM. This component may be an electrolytic. The bulk capacitor should be placed to minimize the distance of the high-current path through the external FETs. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

A low-ESR ceramic capacitor must be placed in between the CPL and CPH pins. A value of 0.1  $\mu\text{F}$  rated for VM is recommended. Place this component as close to the pins as possible.

A low-ESR ceramic capacitor must be placed in between the VM and VCP pins. A value of 1  $\mu\text{F}$  rated for 16 V is recommended. Place this component as close to the pins as possible.

Bypass VINT to ground with a ceramic capacitor rated 6.3 V. Place this bypassing capacitor as close to the pin as possible.

Bypass V5 to ground with a ceramic capacitor rated 6.3 V. Place this bypassing capacitor as close to the pin as possible.

If desired, align the external NMOS FETs as shown on the next page to facilitate layout. Route the AOUT1, AOUT2, BOUT1, and BOUT2 nets to the motor windings.

Use separate traces to connect the xISENP and xISENN pins to the sense resistor terminals.

## 10.2 Layout Example

Figure 22. Board Layout Example

## 11 Device and Documentation Support

### 11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 11.2 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8704DCP	ACTIVE	HTSSOP	DCP	38	50	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	DRV8704	<a href="#">Samples</a>
DRV8704DCPR	ACTIVE	HTSSOP	DCP	38	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	DRV8704	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. - A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusions, mold flash not to exceed 0.15mm.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com). See the product data sheet for details regarding the exposed thermal pad dimensions.
  - E. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

**THERMAL INFORMATION**

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
