

## FEATURES

**Attenuation range: 0.25 dB LSB steps to 31.75 dB**

**Low insertion loss:**

1.1 dB at 1.0 GHz

1.3 dB at 2.0 GHz

**Typical step error: less than  $\pm 0.1$  dB**

**Excellent attenuation accuracy: less than  $\pm 0.2$  dB**

**Low phase shift error: 6° phase shift at 1.0 GHz**

**Safe state transitions**

**High linearity**

1 dB compression (P1dB): 31 dBm typical

Input third-order intercept (IP3): 54 dBm typical

**RF settling time (0.05 dB final RF output): 250 ns**

**Single supply operation: 3.3 V to 5.0 V**

**ESD rating: Class 2 (2 kV human body model (HBM))**

**24-lead, 4 mm  $\times$  4 mm LFCSP package: 16 mm<sup>2</sup>**

## APPLICATIONS

Cellular infrastructure

Microwave radios and very small aperture terminals (VSATs)

Test equipment and sensors

IF and RF designs

## GENERAL DESCRIPTION

The [HMC1119](#) is a broadband, highly accurate, 7-bit digital attenuator, operating from 0.1 GHz to 6.0 GHz with 31.5 dB attenuation control range in 0.25 dB steps.

The [HMC1119](#) is implemented in a silicon process, offering very fast settling time, low power consumption, and high ESD robustness. The device features safe state transitions and is optimized for excellent step accuracy and high linearity over frequency and temperature range. The RF input and output are internally matched to 50  $\Omega$  and do not require any external matching components. The design is bidirectional; therefore, the RF input and output are interchangeable.

## FUNCTIONAL BLOCK DIAGRAM

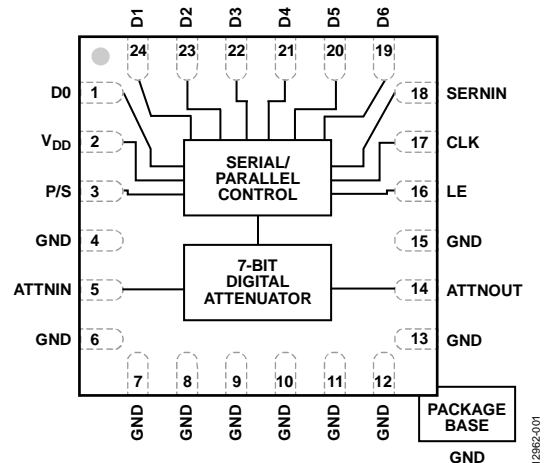

Figure 1.

The [HMC1119](#) has an on-chip regulator that can support a wide supply operating range from 3.3 V to 5.0 V with no performance change in electrical characteristics. The [HMC1119](#) incorporates a driver that supports serial (3-wire) and parallel controls of the attenuator.

The [HMC1119](#) comes in a RoHS-compliant, compact, 4 mm  $\times$  4 mm LFCSP package.

A fully populated evaluation board is available.

		50% CTL to 0.10 dB final RF output	200			ns
INPUT LINEARITY	All attenuation states, 0.2 GHz to 6 GHz					
	0.1 dB Compression (P0.1dB)		30		dBm	
	1 dB Compression (P1dB)		31		dBm	
	Input Third-Order Intercept (IP3)	Two-tone input power = 16 dBm/tone, $\Delta f = 1\text{ MHz}$		54		dBm
SUPPLY CURRENT ( $I_{DD}$ )	$V_{DD} = 3.3\text{ V}$		0.3		mA	
	$V_{DD} = 5.0\text{ V}$		0.6		mA	
CONTROL VOLTAGE THRESHOLD	<1 $\mu\text{A}$ typical					
	Low	$V_{DD} = 3.3\text{ V}$	0	0.5	V	
		$V_{DD} = 5.0\text{ V}$	0	0.8	V	
	High	$V_{DD} = 3.3\text{ V}$	2.0	3.3	V	
		$V_{DD} = 5.0\text{ V}$	3.5	5.0	V	
RECOMMENDED OPERATING CONDITIONS	Supply Voltage Range ( $V_{DD}$ )	3.0		5.4	V	
	Digital Control Voltage Range	For P/S, CLK, SERNIN, LE, D0 to D6 pins	0	$V_{DD}$	V	
	RF Input Power	All attenuation states, $T_{CASE} = 85^\circ\text{C}$		24	dBm	
	Case Temperature ( $T_{CASE}$ )		–40		+85	$^\circ\text{C}$

**ABSOLUTE MAXIMUM RATINGS**

Table 2.

Parameter	Rating
RF Input Power ( $T_{CASE} = 85^{\circ}C$ )	25 dBm
Digital Control Inputs (P/S, CLK, SERNIN, LE, D0 to D6)	-0.3 V to $V_{DD} + 0.5$ V
Supply Voltage ( $V_{DD}$ )	-0.3 V to +5.5 V
Continuous Power Dissipation ( $P_{DISS}$ )	0.31 W
Thermal Resistance (at Maximum Power Dissipation)	156°C/W
Temperature	
Channel Temperature	135°C
Storage	-65°C to +150°C
Maximum Reflow Temperature	260°C (MSL3 Rating)
ESD Sensitivity (HBM)	2 kV (Class 2)

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

**ESD CAUTION**

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES  
 1. THE EXPOSED PAD AND GND PINS MUST BE CONNECTED TO RF DC GROUND.

12892-002

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 19 to 24	D0, D6 to D1	Parallel Control Voltage Inputs. These pins attain the required attenuation (see Table 5). There is no internal pull-up or pull-down on these pins; therefore, these pins must always be kept at a valid logic level ( $V_{IH}$ or $V_{IL}$ ) and must not be left floating.
2	$V_{DD}$	Supply Voltage Pin.
3	P/S	Parallel/Serial Control Input. There is no internal pull-up or pull-down on this pin; therefore, this pin must always be kept at a valid logic level ( $V_{IH}$ or $V_{IL}$ ) and must not be left floating. For parallel mode, set Pin 3 to low; for serial mode, set Pin 3 to high.
4, 6 to 13, 15	GND	Ground. The package bottom has an exposed metal pad that must connect to the printed circuit board (PCB) RF/dc ground. See Figure 4 for the GND interface schematic.
5	ATTNIN	Attenuator Input. This pin is dc-coupled and matched to 50 $\Omega$ . A blocking capacitor is required. Select the value of the capacitor based on the lowest frequency of operation. See Figure 5.
14	ATTNOUT	Attenuator Output. This pin is dc-coupled and matched to 50 $\Omega$ . A blocking capacitor is required. Select the value of the capacitor based on the lowest frequency of operation. See Figure 5.
16	LE	Serial/Parallel Interface Latch Enable Input. There is no internal pull-up or pull-down on this pin; therefore, this pin must always be kept at a valid logic level ( $V_{IH}$ or $V_{IL}$ ) and must not be left floating. See the Theory of Operation section for more information.
17	CLK	Serial Interface Clock Input. There is no internal pull-up or pull-down on this pin; therefore, this pin must always be kept at a valid logic level ( $V_{IH}$ or $V_{IL}$ ) and must not be left floating. See the Theory of Operation section for more information.
18	SERNIN	Serial interface Data Input. There is no internal pull-up or pull-down on this pin; therefore, this pin must always be kept at a valid logic level ( $V_{IH}$ or $V_{IL}$ ) and must not be left floating. See the Theory of Operation section for more information.
	EPAD	Exposed Pad. The exposed pad must be connected to RF/dc ground.

## THEORY OF OPERATION

The HMC1119 incorporates a 7-bit fixed attenuator array that offers an attenuation range of 0.25 dB to 31.75 dB, with 0.25 dB steps. An integrated driver provides both serial and parallel mode control of the attenuator array (see Figure 22).

The HMC1119 can be in either serial or parallel mode control by setting the P/S pin to high or low, respectively (see Table 4). The 7-bit data, loaded in either serial or parallel mode, then latches with the control signal, LE, to determine the attenuator value.

**Table 4. Mode Selection Table<sup>1</sup>**

P/S Pin State	Control Mode
Low	Parallel
High	Serial

<sup>1</sup> The P/S pin must always be kept at a valid logic level ( $V_{IH}$  or  $V_{IL}$ ) and must not be left floating.

### SERIAL CONTROL INTERFACE

The HMC1119 utilizes a 3-wire serial to parallel (SPI) configuration, as shown in the serial mode timing diagram (see Figure 23): serial data input (SERIN), clock (CLK), and latch enable (LE). The serial control interface activates when the P/S pin is set to high.

In serial mode, the 7-bit SERIN data is clocked MSB first on rising CLK edges into the shift register; then, LE must be toggled high to latch the new attenuation state into the device. The LE must be set low to clock a set of 7-bit data into the shift register because CLK is masked to prevent the attenuator value from changing if LE is kept high.

In serial mode operation, both the serial control inputs (LE, CLK, SERIN) and the parallel control inputs (D0 to D6) must always be kept at a valid logic level ( $V_{IH}$  or  $V_{IL}$ ) and must not be left floating. It is recommended to connect the parallel control inputs to ground and to use pull-down resistors on all serial control input lines if the device driving these input lines goes high impedance during hibernation.

### PARALLEL CONTROL INTERFACE

The parallel control interface has seven digital control input lines (D6 to D0) to set the attenuation value. D6 is the most significant bit (MSB) that selects the 16 dB attenuator stage, and D0 is the least significant bit (LSB) that selects the 0.25 dB attenuator stage (see Figure 22).

In parallel mode operation, both the serial control inputs (LE, CLK, SERIN) and the parallel control inputs (D0 to D6) must always be

kept at a valid logic level ( $V_{IH}$  or  $V_{IL}$ ) and must not be left floating. It is recommended to connect the serial control inputs to ground and to use pull-down resistors on all parallel control input lines if the device driving these input lines goes high impedance during hibernation.

Setting P/S to low enables parallel mode. There are two modes of parallel operation: direct parallel mode and latched parallel mode.

#### Direct Parallel Mode

For direct parallel mode, the latch enable (LE) pin must be kept high. Change the attenuation state using the control voltage inputs (D0 to D6) directly. This mode is ideal for manual control of the attenuator and using hardware, switches, or a jumper.

#### Latched Parallel Mode

The latch enable (LE) pin must be low when changing the control voltage inputs (D0 to D6) to set the attenuation state. When the desired state is set, LE must be toggled high to transfer the 7-bit data to the bypass switches of the attenuator array, then toggled low to latch the change into the device (see Figure 24).

### RF INPUT OUTPUT

The attenuator in the HMC1119 is bidirectional; the ATTNIN and ATTNOUT pins are interchangeable as the RF input and output ports. The attenuator is internally matched to 50  $\Omega$  at both input and output; therefore, no external matching components are required. The RF pins are dc-coupled; therefore, dc blocking capacitors are required on RF lines.

### POWER-UP SEQUENCE

The ideal power-up sequence is as follows:

1. Power up GND.
2. Power up  $V_{DD}$ .
3. Power up the digital control inputs (the relative order of the digital control inputs is not important).
4. Power up the RF input.

For latched parallel mode operation, LE must be toggled. The relative order of the digital inputs is not important as long as the inputs are powered up after GND and  $V_{DD}$ .

#### Power-Up States

The logic state of the device is at maximum attenuation when, at power up, LE is set to low. The attenuator latches in the desired power-up state approximately 200 ms after power up.

Figure 22. Attenuator Array Functional Block Diagram

Table 5. Truth Table

Digital Control Input <sup>1</sup>							Attenuation State (dB)
D6	D5	D4	D3	D2	D1	D0	
Low	Low	Low	Low	Low	Low	Low	0 (reference)
Low	Low	Low	Low	Low	Low	High	0.25
Low	Low	Low	Low	Low	High	Low	0.5
Low	Low	Low	Low	High	Low	Low	1.0
Low	Low	Low	High	Low	Low	Low	2.0
Low	Low	High	Low	Low	Low	Low	4.0
Low	High	Low	Low	Low	Low	Low	8.0
High	Low	Low	Low	Low	Low	Low	16.0
High	High	High	High	High	High	High	31.75

<sup>1</sup> Any combination of the control voltage input states shown in Table 5 provides an attenuation equal to the sum of the bits selected.

## APPLICATIONS INFORMATION

### EVALUATION PRINTED CIRCUIT BOARD

The schematic of the evaluation board, [EV2HMC1119LP4M](#), is shown in Figure 25. The PCB is four-layer material with a copper thickness of 0.7 mils on each layer. Each copper layer is separated with a dielectric material. The top dielectric material is 10-mil RO4350 with a typical dielectric constant of 3.48. The middle and bottom dielectric materials are FR-4 material, used for mechanical strength and to meet the overall board thickness of approximately 62 mils, which allows SMA connectors to be slipped in at board edges.

All RF and dc traces are routed on the top copper layer. The RF transmission lines are designed using coplanar waveguide model (CPWG) with a width of 18 mils, spacing of 17 mils, and dielectric thickness of 10 mils to maintain 50  $\Omega$  characteristic impedance. The inner and bottom layers are solid ground planes. For optimal electrical and thermal performance, an ample number of vias are populated around the transmission lines and under the package exposed pad. The evaluation board layout serves as a recommendation for the optimal performance on both electrical and thermal aspects.
