LV52207NXA

Bi-CMOS LSI

Dual channel LED Boost Driver with PWM and 1-Wire Dimming

Overview

The LV52207NXA is a high voltage boost driver for LED drive with 2 channels adjustable constant current sources.

Function

- Operating Voltage from 2.7V to 5.5V
- Integrated 40V MOSFET
- 1-Wire 255 level digital and PWM dimming
- Supports CABC
- 600kHz Switching Frequency
- 37.5V OVP Threshold

WLP9, 1.31x1.31, 0.4mm pitch
(1.31mm x 1.31mm, Amax=0.625 mm)

Typical Applications

LED Display Backlight Control

Fig1. 5x2 LED Application

ORDERING INFORMATION

See detailed ordering and shipping information on page 18 of this data sheet.

LV52207NXA

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V _{CC} max	V _{CC}	6	V
Maximum Pin voltage1	V1 max	SW	40	V
Maximum Pin voltage2	V2 max	Other pin	5.5	V
Allowable power dissipation	Pd max	Ta=25°C *1	0.95	W
Operating temperature	Topr		-40 to +85	°C
Storage temperature	Tstg		-55 to +125	°C

*1 Mounted on a specified board: 70mm×70mm×1.6mm (4 layer glass epoxy)

Caution 1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range1	V _{CC} op	V _{CC}	2.7 to 5.5	V
PWM frequency	Fpwm	PWM pin input signal	300 to 100k	Hz
MIN DUTY (PWM pin)	Dminpwm	PWM pin input signal	0.9%	

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Electrical Characteristics Analog block

at Ta=25°C, V_{CC}=3.6V, RT resistor=63.4KΩ unless otherwise specified

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Standby current dissipation	I _{cc1}	EN=PWM=L		0	2	μA
DC/DC current dissipation1	I _{cc2}	Device enable, switching 0.6 MHz and no load		0.7	1.2	mA

LV52207NXA is as follows.

MARKING DIAGRAM

D7 = Device Code
 YXX = Assembly Lot Code

LV52207NXA

Pin Function

PIN #	Pin Name	Description
A1	RT	Connecting a resistor terminal for Full scale LED current setting
A2	LEDO2	Constant Current Output_pin2
A3	LEDO1	Constant Current Output_pin1
B1	PWM	PWM dimming input (active High).
B2	FCAP	Filtering capacitor terminal for PWM mode
B3	GND	Ground
C1	EN	1-wire control and Enable control input (active High).
C2	VIN	Supply voltage.
C3	SW	Switch pin. Drain of the internal power FET.

Pd-Max

Mounted on a specified board : 70mm×70mm×1.6mm (4 layer glass epoxy)

LED Current Setting (max sink current)

LED_full current is set by an external resistor connected between the RT pin and ground.

$$I(\text{LED_full}) = 2113 \times (V(\text{RT})/R(\text{RT_res}))$$

V(RT) : RT_pin DC Voltage typ=0.6V

R(RT_res) : RT_pin resistor

RT_res=63.4kΩ : I(LED_full)=20mA

BRIGHTNESS CONTROL

The LV52207NXA controls the DC current of the dual channels. The DC current control is normally referred to as analog dimming mode.

The LV52207NXA can receive digital commands at the EN pin (1-wire digital interface) (**Digital Mode**) and the PWM signals at the PWM pin (PWM interface) (**PWM Mode**) for brightness dimming.

Dimming Mode Selection

Dimming Mode is selected by a specific pattern of the EN pin within Tsel(1ms) from the startup of the device every time.

Digital Mode

To enter Digital Mode, EN pin should be taken high for more than Tw0(100μs) from the first rising edge and keep low state for Tw1(260μs) before Tsel(1ms). When using Digital mode, the PWM pin should be kept high.

It is required sending the device address byte and the data byte to select LEDI. The bit detection is determined by the ratio of Th and Tl(See Fig5). The start condition for the bit transmission required EN pin high for at least Tstart. The end condition is required EN pin low for at least Tend. When data is not being transferred, EN pin is set in the “H” state. These registers are initialized with shutdown.

Start up and Shutdown

The device becomes enabled when EN pin is initially taken high. The dimming mode is determined within Tsel and the boost converter start up after Tdel. To place the device into shutdown mode, the SWIRE must be held low for Toff.

Digital MODE

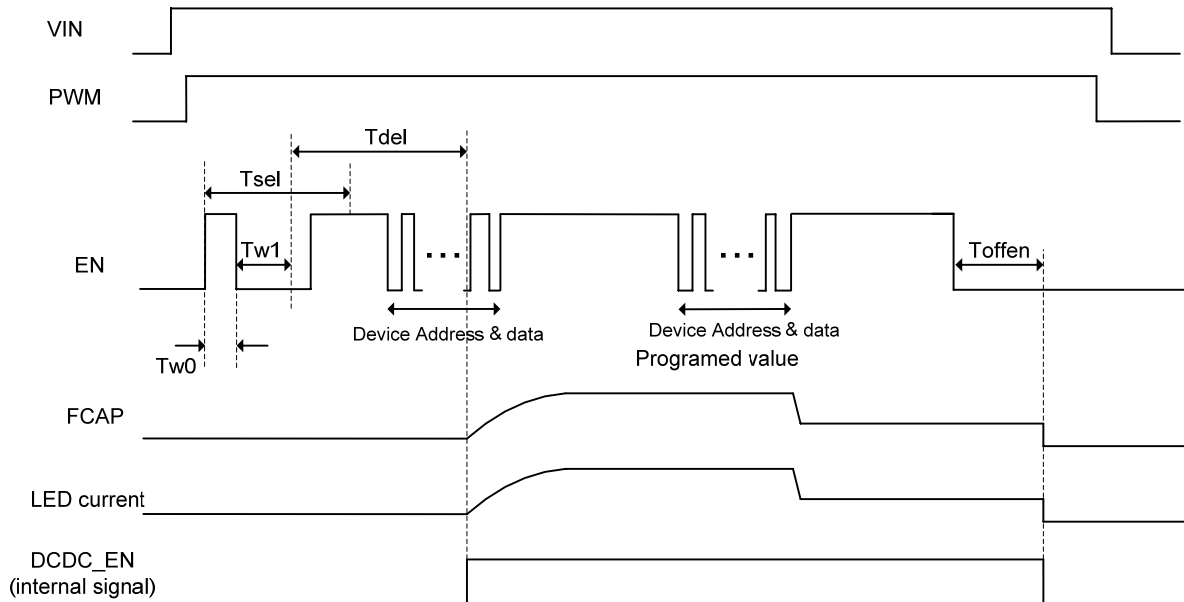

Fig3. Start up and shutdown diagram (**DIGITAL MODE**)

1-Wire Programming

Figure 15 and Table 2 give an overview of the protocol used by LV52207NXA. A command consists of 24 bits, including an 8-bit device address byte and a 16-bit data byte. All of the 24 bits should be transmitted together each time, and the LSB bit should be transmitted first. In the LV52207NXA, the device address (DA7(MSB)to DA0(LSB)) is specified as "10001111". AKct is setting for the acknowledge response. If the device address and the data byte are transferred on AKct=1, the ACK signal is sent from the receive side to the send side. The acknowledge signal is issued when EN pin on the send side is released and EN pin on the receive side is set to low state.

Table2. Data Register vs LED current sink

PWM Mode

The dimming mode is set to PWM mode when it is not recognized as a digital mode within Tsel. The LV52207NXA can receive the PWM signals at the PWM pin (PWM interface)(**PWM Mode**) for brightness dimming. When using PWM interface, the EN pin should be kept high. If EN pin is H, PWM pin alone is used to enable and disable the IC. When EN pin is H and PWM pin is H, this IC is enable. When EN pin more than 2.5ms are low or when PWM pin more than 20ms are low, the IC is disable.

Fig6. Start up and shutdown diagram (**PWM MODE**)

LEDO1 or LEDO2 UNUSED

If only one channel is used, a user can be made to OFF by connecting to ground the unused channel. If LEDO1 pin and LEDO2 pin are connected to ground, dc/dc will not start up.

Over Voltage Protection (SW OVP)

SW pin over-voltage protection is set at 37.5V. **This IC monitors the Voltage at SW pin.** When the voltage exceed OVP threshold, the switching converter stops switching.

If SW terminal voltage exceeds a threshold V_{ovp} (37.5V typ) for 8 cycles, boost converter enters shutdown mode. In order to restart the IC, SWIRE signal is required again.

Over Voltage Protection (LEDO OVP)

LED pin over-voltage protection is set at 4.5V(rise) 3.5V(fall). **This IC monitors the Voltage at LEDO1 pin and LEDO2 pin.** When the voltage exceed LEDO OVP threshold, the switching converter stops switching. LED current sink keep.

Open LED Protection

< When one LED string becomes open.>

If one LED string is open, open channel voltage is about ground, the boost output voltage is increased and other LEDO channel voltage is increased. When SW pin voltage is reached the SW OVP threshold the LV52207NXA's switching converter stops switching. When other LEDO pin voltage is reached the LEDO OVP threshold, the LV52207NXA's switching converter stops switching.

< When both LED strings become open.>

If both LED strings are open, LEDO1 pin voltage and LEDO2 pin voltage is about ground, and the boost output voltage is increased

When SW pin voltage is reached the SW OVP threshold the LV52207NXA's switching converter stops switching.

Over Current Protection

Current limit value for built-in power MOS is around 1.5A. The power MOS is turned off for each switching cycle when peak current through it exceeds the limit value.

Under Voltage Lock Out (UVLO)

UVLO operation works when VIN terminal voltage is below 2.2V.

Thermal Shutdown

When chip temperature is too high, boost converter is stopped.
