Direct-Conversion Tuner ICs for Digital DBS Applications

MAX2102/MAX2105

General Description

The MAX2102/MAX2105† are low-cost direct-conversion tuner ICs designed for use in digital direct-broadcast satellite (DBS) television set-top box units. The direct-conversion architecture reduces system cost compared to devices with IF-based architectures.

The MAX2102/MAX2105 directly tune L-band signals to baseband using a broadband I/Q downconverter. Operating frequency range spans from at least 950MHz to 2150MHz.

The ICs include a low-noise amplifier (LNA) with automatic gain control (AGC), two downconverter mixers, an oscillator buffer with 90° quadrature generator and prescaler, and baseband amplifiers.

The MAX2102 features an AGC range of 50dB, allowing input power levels as low as -69dBm. The MAX2105 has a reduced AGC range of 41dB and accepts input power levels down to -60dBm. The reduced AGC range of the MAX2105 allows the use of a high-gain external LNA to achieve a lower system noise figure (NF).

Applications

DBS Tuners

DVB-Compliant DBS Tuners

Cellular Base Stations

Wireless Local Loop

Broadband Systems

LMDS

Features

♦ **Low-Cost Bipolar Design, Lowest Cost Architecture**

♦ **Operate from a Single +5V Supply**

♦ **950MHz to 2150MHz Input Frequency Range***

♦ **On-Chip Quadrature Generator, Dual-Modulus Prescaler (/64, /65)**

♦ **Input Levels**
   -69dBm to -19dBm per Carrier (MAX2102)
   -60dBm to -19dBm per Carrier (MAX2105)

♦ **Over 50dB AGC Control Range (MAX2102)**

♦ **Noise Figure = 13.2dB (MAX2102);**
   IP3 = 6.5dBm (at 1450MHz)

♦ **Automatic Baseband Offset Correction**

♦ **Easy Interface to MAX1002/MAX1003 Dual ADC and Popular Baseband ICs**

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX2102CWI	0°C to +70°C	28 SO
MAX2105CWI	0°C to +70°C	28 SO

Direct-Conversion Tuner ICs for Digital DBS Applications

ABSOLUTE MAXIMUM RATINGS

V_{CC} to GND ....-0.5V to +7V
RFIN to $\overline{RFIN}$ ....±2V
LO to $\overline{LO}$ ....±2V
AGC, MOD, RFIN, $\overline{RFIN}$, LO, $\overline{LO}$ to GND .....-0.5V to (V_{CC} + 0.5V)
AGC Current. ....±30mA
IDC to $\overline{IDC}$, QDC to $\overline{QDC}$ ....±2V
IOUT or QOUT to GND Short-Circuit Duration 10sec
PSOUT to GND Short-Circuit Duration................................None

IDC, $\overline{IDC}$, QDC, $\overline{QDC}$ to GND ....-0.5V to (V_{CC} + 0.5V)
Continuous Power Dissipation (T_A = +70°C)
  SO (derate 12.5mW/°C above +70°C) 1.025W
Operating Temperature Range...............................0°C to +70°C
Junction Temperature ....+150°C
Storage Temperature Range ....-65°C to +150°C
Lead Temperature (soldering, 10sec) ....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = +4.75V to +5.25V; GND = 0V; PSGND = GND; AGC = 1.3V; MOD = 0.8V; P_{RFIN} = OFF, f_{LO} = 1450.125MHz; P_{LO} = -15dBm; IOUT, QOUT = open; T_A = 0°C to +70°C; unless otherwise noted.)

PARAMETER	CONDITIONS		MIN	TYP	MAX	UNITS
SUPPLY						
Operating Supply Voltage Range			4.75		5.25	V

| PIN	NAME	FUNCTION
1	V$_{CC}$	Baseband +5V Supply. Bypass with a 10pF capacitor from this pin to pin 3 (GND), as close to the IC as possible. Connect an additional 0.1µF capacitor in parallel with the 10pF capacitor (placement less critical).
2	IOUT	I Channel Baseband Output
3, 12	GND	Baseband Ground
4	V$_{CC}$	RF +5V Supply. Bypass with a 22pF capacitor from this pin to pin 11 (GND), as close to the IC as possible.
5	GND	Ground (substrate)
6	V$_{CC}$	RF +5V Supply. Bypass with a 22pF capacitor from this pin to pin 9 (GND), as close to the IC as possible.
7	RFIN	RF Noninverting Input. Couple through a 22pF capacitor directly to a 50Ω signal source.
8	$\overline{\text{RFIN}}$	RF Inverting Input. Connect to a 22pF series capacitor and a 51Ω resistor to ground.
9, 11, 19, 24	GND	RF Ground. Connect directly to the ground plane.
10	AGC	Automatic Gain-Control Input. Bypass this pin with a 1000pF capacitor close to the pin, to minimize coupling.
13	QOUT	Q Channel Baseband Output
14	V$_{CC}$	Baseband +5V Supply. Bypass with a 10pF capacitor from this pin to pin 12 (GND), as close to the IC as possible. Connect an additional 0.1µF capacitor in parallel with the 10pF capacitor (placement less critical).
15	QDC	Q Channel Offset-Correction Noninverting Input. Connect a 0.22µF (typ) capacitor between QDC and $\overline{\text{QDC}}$. This capacitor must be placed as close to the IC as possible (see *Layout Considerations* section).
16	$\overline{\text{QDC}}$	Q Channel Offset-Correction Inverting Input. Connect a 0.22µF (typ) capacitor between QDC and $\overline{\text{QDC}}$. This capacitor must be placed as close to the IC as possible (see *Layout Considerations* section).
17	$\overline{\text{IDC}}$	I Channel Offset-Correction Inverting Input. Connect a 0.22µF (typ) capacitor between IDC and $\overline{\text{IDC}}$. This capacitor must be placed as close to the IC as possible (see *Layout Considerations* section).
18	IDC	I Channel Offset-Correction Noninverting Input. Connect a 0.22µF (typ) capacitor between IDC and $\overline{\text{IDC}}$. This capacitor must be placed as close to the IC as possible (see *Layout Considerations* section).
20	V$_{CC}$	RF +5V Supply. Bypass with a 10pF capacitor from this pin to pin 19 (GND) as close to the IC as possible.
21	$\overline{\text{LO}}$	Local-Oscillator Complementary Input Port (Figure 1)
22	LO	Local-Oscillator Input Port (Figure 1)
23	V$_{CC}$	RF +5V Supply. Bypass with a 10pF capacitor from this pin to pin 24 (GND) as close to the IC as possible.
25	PSGND	Prescaler Ground. To disable the prescaler, leave this pin open.
26	PSOUT	Prescaler Output. Drives CMOS load. Connect 2kΩ from this pin to GND (if the prescaler is enabled).
27	MOD	Prescaler Modulus Control. Leave open when the prescaler is disabled.
28	V$_{CC}$	Prescaler +5V Supply. **Must be connected even if the prescaler is disabled.** Bypass with a 1000pF capacitor.
MAX2102/MAX2105

Figure 1. Typical Operating Circuit

Detailed Description

The MAX2102/MAX2105 down-convert signals in the range 950MHz to 2150MHz directly to baseband I/Q signals. They are targeted for digital DBS tuner applications where a direct downconversion provides a cost savings over prior-art, multiple-conversion approaches. However, the MAX2102/MAX2105 are applicable to any system requiring a broadband I/Q downconversion.

Internally, the MAX2102 and MAX2105 consist of a broadband front-end variable gain stage, a quadrature downconverter, an oscillator buffer, high-linearity I and Q baseband amplifiers, and offset correction amplifiers.

The MAX2102 features a front-end AGC dynamic range of over 50dB, while the MAX2105 provides a front-end

AGC dynamic range of over 41dB. Specifically, the AGC control can be adjusted so that a sine wave at RFIN ranging in power from -69dBm to -19dBm (MAX2102) or -60dBm to -19dBm (MAX2105) will produce a sine wave at IOUT and QOUT at 500mVp-p levels. The noise figure is lowest when the AGC is at its maximum gain setting (see *Typical Operating Characteristics*). The VSWR at RFIN is unaffected by the AGC setting.

The local-oscillator (LO) buffer accepts an external LO signal at LO, $\overline{LO}$, and internally limits the signal to provide a consistent on-chip LO level. The LO input drive level should be maintained within the specified limits (see *Applications Information* section).

MAXIM

The quadrature downconverter follows the front-end AGC. Two mixers are driven by the previous stage AGC amplifier output. The mixer LO ports are fed with the two LO signals, which are 90° apart in phase. These quadrature LO signals are generated on-chip using the LO signal from the LO buffer.

The resulting I/Q baseband signals are fed through separate I and Q channel baseband amplifiers. Robust output stages drive IOUT and QOUT. The outputs are capable of driving lowpass filters with 100Ω character-

istic impedance (that is, the equivalent of an AC-coupled, 100Ω load). The baseband -3dB output bandwidth is over 90MHz.

_____Applications Information

Front-End Tuner Circuitry
for DBS Tuners

In a typical application, the signal path ahead of the MAX2102/MAX2105 will include a discrete LNA/buffer and a PIN-diode attenuator. Alternatively, a dual-gate

Figure 2. Typical Application

Direct-Conversion Tuner ICs for Digital DBS Applications

GaAsFET can serve this function. This circuitry is usually required in order to meet system noise-figure requirements, may provide a buffered F-connector output, and may also be required to meet stringent LO leakage requirements. The PIN attenuator is typically controlled by the same voltage as the MAX2102/MAX2105 AGC control pin so that, overall, a single AGC line from the baseband processor can control the entire tuner.

In some applications, a varactor-tuned preselection bandpass filter is added between the discrete LNA and the MAX2102/MAX2105. This is usually required only for very high-linearity tuners, such as those designed for single channel-per-carrier (low-data-rate) applications. The filter provides a means of broadly filtering adjacent interferers, thus improving the tuner's intermodulation performance. Additionally, the filter removes the RF interference at twice the LO frequency, which would otherwise add to cochannel interference (the MAX2102/MAX2105 alone reject this carrier to typically -32.3dBc).

External Oscillator

Since the MAX2102/MAX2105 are direct-conversion receivers, the external LO must tune to the same frequencies as the desired RF input signals.

The MAX2102/MAX2105 oscillator input port (LO, $\overline{LO}$) accepts either a single-ended or differential (balanced) LO signal. A differential LO offers reduced LO leakage to the RFIN port, as well as lower spurious downconversion levels of RF signals, which are at twice the LO frequency. Refer to Figure 3 for differential LO connections. For best performance, ensure that the LO and $\overline{LO}$ traces are symmetrical.

The LO drive levels should be maintained to within the specified limits. If the LO drive falls below the specified range, quadrature performance may be affected. Driving LO above the specified limits will cause a higher LO leakage level at RFIN; this may be acceptable in some applications. The MAX2102/MAX2105 offset-correction loop can withstand LO leakage levels corresponding to at least 0dBm of LO input power drive.

Prescaler

Typical stand-alone tuner applications will not use the MAX2102/MAX2105 prescaler function, but instead use a commercial synthesizer IC such as the Philips TSA5055, which has an internal prescaler. To disable the MAX2102/MAX2105 prescaler, disconnect the PSGND pin (leave open). The prescaler will cause an output spur in the baseband spectrum, to a level of about -20dBc (referred to 500mVp-p baseband output level) that may land within the desired signal bandwidth in some applications.

Figure 3. Differential LO Drive

To use the MAX2102/MAX2105 prescaler, connect the PSGND pin to ground. In some applications, the prescaler may be toggled on and off using a MOSFET to switch PSGND to ground. PSGND should be forced to within 100mV of ground, and the MOSFET must be capable of sinking 15mA. PSOUT is capable of driving a typical CMOS load of 10kΩ in parallel with 5pF. A 2kΩ pull-down resistor must be connected from PSOUT to GND.

The prescaler requires a stable level at the MOD pin 12ns before the falling edge of PREOUT to assert the desired modulus. The level at MOD must remain static until 3ns after this falling edge.

Baseband Amplifiers

The MAX2102/MAX2105 baseband amplifiers provide over 2Vp-p swing at IOUT and QOUT, and are capable of driving 100Ω. IOUT and QOUT must be AC-coupled to any lowpass filters. In a typical application, IOUT and QOUT drive a 5th or 7th-order lowpass filter for ADC anti-aliasing purposes (see the *Systems Considerations: Lowpass Filters in Direct-Conversion Tuners* section). After the filters, in some cases, additional gain may be required. This can be accomplished with a pair of video-speed op amps, such as the MAX4216 dual-video op amp. Alternatively, the MAX1002/MAX1003 dual ADC has built-in gain ahead of the ADCs, digitizing levels as low as 125mVp-p. Contact Maxim for more information about the MAX4216 or the MAX1002/MAX1003.

ſVI/IXI/VI

Offset Correction

The internal offset-correction amplifiers remove the DC offsets present in the baseband amplifiers. The offset-correction loop effectively AC-couples the baseband signal path, yielding a -3dB highpass corner frequency according to the following:

$$f_{-3dB} = 100/C_{DC} \ (\mu F)$$

where C_{DC} is the value of the capacitors, in microfarads, across QDC, $\overline{QDC}$ and IDC, $\overline{IDC}$.

For applications where the DC information must be maintained through the signal path, the offset correction can be disabled by connecting QDC, $\overline{QDC}$, IDC, and $\overline{IDC}$ directly to ground. Disabling the offset correction will effectively limit the input dynamic range of the MAX2102/MAX2105. Typical input dynamic range will be approximately -45dBm to -19dBm for single-ended LO drive, and -55dBm to -19dBm for differential LO drive.

Layout Considerations

Observe standard RF layout rules. A ground plane is essential; when connecting areas of ground plane between layers, use vias liberally. Remove the ground plane under the external VCO area to reduce parasitic capacitance. If a ground plane is used under the low-pass filters, note that the filter shape may be slightly offset due to parasitic capacitance.

In a direct-conversion receiver, LO leakage to the RF input connector is a major issue, since filtering of the LO is impossible (the LO operates at the same frequency as the RF input). The external VCO section should be housed in a separate shielded compartment, if possible. Use of a differential (balanced) LO will dramatically reduce LO leakage. Also, the use of coplanar, waveguide transmission-line structures reduces LO leakage (used on the MAX2102 EV kit).

Observe the power-supply bypass capacitor connections in the *Pin Description* table, notably pins 1, 3, 4, 6, 9, 11, 12, 14, 19, 20, 23, and 24. Traces from these IC pins to the bypass capacitors must be kept to an absolute minimum. Where possible, make these connections on the top side of the board.

The MAX2102 EV kit includes ferrite beads in series with power-supply leads. The beads may not be required for all applications.

Table 1. Suggested Component Values for Discrete Lowpass Filters (0.1dB Ripple Chebyshev Type)

ADC SAMPLING RATE (Msps)	FILTER TYPE	R_S (Ω)	C1 (pF)	L1 (nH)	C2 (pF)	L2 (nH)	C3 (pF)	L3 (nH)	C4 (pF)	R_L (kΩ)
40	0.1dB Chebyshev, f_C = 20MHz	100	39	910	120	1500	150	1500	120	10
60	0.1dB Chebyshev, f_C = 30MHz	100	22	620	82	910	100	1000	82	10
90	0.1dB Chebyshev, f_C = 45MHz	100	18	390	56	620	68	680	56	10

Note: Suggested types: Inductors: Coilcraft 1008CS, tolerance = ±5%; Capacitors: use tolerance = ±2%. Refer to Figure 2 for circuit diagram.

Direct-Conversion Tuner ICs for Digital DBS Applications

Power-Supply Sequencing

The MAX2102/MAX2105 have several +5V supply pins. The supply layout should be in a star format, with a bypass capacitor that dominates the rise time of the supply at the center of the star, to ensure that all pins see approximately the same voltage during power-up.

The prescaler V_{CC} (pin 28) must be connected to the same V_{CC} as the other V_{CC} pins, even if the prescaler is not used. Leaving PSGND open will disable the prescaler function and, in this state, the prescaler will not dissipate any power.

Systems Consideration: Lowpass Filters in Direct-Conversion Tuners

Typically, a 5th or 7th-order L-C lowpass filter is used for anti-aliasing the ADCs following the MAX2102. Figures 4 and 5 describe typical filtering requirements. Table 1 offers suggested component values for these lowpass filters.
