

16-Channel/Dual 8-Channel, Low-Leakage, CMOS Analog Multiplexers

MAX336/MAX337

General Description

Features

The MAX336/MAX337 are monolithic, CMOS analog multiplexers (muxes). The 16-channel MAX336 is designed to connect one of 16 inputs to a common output by control of a 4-bit binary address. The dual, 8-channel MAX337 is designed to connect one of eight inputs to a common output by control of a 3-bit binary address. Both devices can be used as either a mux or a demux. On-resistance is 400Ω (max), and the devices conduct current equally well in both directions.

- ◆ <400Ω (max) On-Resistance
- ◆ <500ns Transition Time
- ◆ <10Ω On-Resistance Match
- ◆ <20pA NO-Off Leakage Current at +25°C
- ◆ 3.5pC Charge Injection
- ◆ +4.5V to +30V Single Supply
±4.5V to ±20V Dual Supplies
- ◆ Plug-In Upgrade for Industry-Standard DG506/DG507
- ◆ Bidirectional Rail-to-Rail® Signal Handling
- ◆ TTL/CMOS-Logic Compatible
- ◆ >2000V ESD Protection, per Method 3015.7

These muxes feature extremely low off leakages (less than 20pA at +25°C) and on-channel leakages (less than 50pA at +25°C). The new design offers guaranteed low charge injection (3.5pC typical) and electrostatic discharge (ESD) protection greater than 2000V, per method 3015.7. These improved muxes are pin-compatible upgrades for the industry-standard DG506 and DG507.

The MAX336/MAX337 operate from a single +4.5V to +30V supply or from dual ±4.5V to ±20V supplies. All control inputs (whether address or enable) are TTL compatible (0.8V to 2.4V) over the full specified temperature range and over the ±4.5V to ±18V supply range.

Note 2: The algebraic convention where the most negative value is a minimum and the most positive value a maximum is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: ΔR_{ON} = R_{ON(MAX)} - R_{ON(MIN)}.

Note 5: Leakage parameters are 100% tested at the maximum rated hot temperature and guaranteed by correlation at T_A = +25°C.

Note 6: Worst-case isolation is on channel 4 because of its proximity to the drain pin. Off isolation = 20log V_{COM}/V_{NO}, where V_{COM} = output and V_{NO} = input to off switch.

Applications Information

Operation with Supply Voltages Other than 15V

Using supply voltages less than $\pm 15\text{V}$ will reduce the analog signal range. The MAX336/MAX337 switches operate with $\pm 4.5\text{V}$ to $\pm 20\text{V}$ bipolar supplies or with a $+4.5\text{V}$ to $+30\text{V}$ single supply. Connect V- to GND when operating with a single supply. Both device types can also operate with unbalanced supplies such as $+24\text{V}$ and -5V . The *Typical Operating Characteristics* graphs show typical on-resistance with 20V, 15V, 10V, and 5V supplies. (Switching times increase by a factor of two or more for operation at 5V.)

Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings, because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence V+ on first, then V-, followed by the logic inputs NO and COM. If power-supply sequencing is not possible, add two small signal diodes in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to 1V below V+ and 1V above V-, but does not significantly affect the devices' low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between V+ and V- should not exceed 44V.
