

MAXIM

Low-Cost, SC70, Voltage-Output, High-Side Current-Sense Amplifier

General Description

The MAX4073 low-cost, high-side current-sense amplifier features a voltage output that eliminates the need for gain-setting resistors making it ideal for cell phones, notebook computers, PDAs, and other systems where current monitoring is crucial. High-side current monitoring does not interfere with the ground path of the battery charger making the MAX4073 particularly useful in battery-powered systems. The input common-mode range of +2V to +28V is independent of the supply voltage. The MAX4073's wide 1.8MHz bandwidth makes it suitable for use inside battery-charger control loops.

The combination of three gain versions and a selectable external-sense resistor sets the full-scale current reading. The MAX4073 offers a high level of integration, resulting in a simple and compact current-sense solution.

The MAX4073 operates from a +3V to +28V single supply and draws only 0.5mA of supply current. This device is specified over the automotive operating temperature range (-40°C to +125°C) and is available in a space-saving 5-pin SC70 package (half the size of the SOT23).

For a similar device in a 6-pin SOT23 with a wider common-mode voltage range (0 to +28V), see the MAX4173 data sheet.

Applications

Cell Phones
 Notebook Computers
 Portable/Battery-Powered Systems
 Smart Battery Packs/Chargers
 PDAs
 Power Management Systems
 PA Bias Control
 General System/Board-Level Current Monitoring
 Precision Current Sources

Features

- ◆ Low-Cost, Compact, Current-Sense Solution
- ◆ Three Gain Versions Available
 - +20V/V (MAX4073T)
 - +50V/V (MAX4073F)
 - +100V/V (MAX4073H)
- ◆ ±1.0% Full-Scale Accuracy
- ◆ 500µA Supply Current
- ◆ Wide 1.8MHz Bandwidth
- ◆ +3V to +28V Operating Supply
- ◆ Wide +2V to +28V Common-Mode Range Independent of Supply Voltage
- ◆ Automotive Temperature Range (-40°C to +125°C)
- ◆ Available in Space-Saving 5-Pin SC70 Package

MAX4073T/F/H

Typical Operating Circuit

Pin Description

PIN		NAME	FUNCTION
SOT23-6	SC70-5		
1, 2	2	GND	Ground
3	3	VCC	Supply Voltage Input. Bypass to GND with a 0.1μF capacitor.
4	4	RS+	Power-Side Connection to the External Sense Resistor
5	5	RS-	Load-Side Connection to the External Sense Resistor
6	1	OUT	Voltage Output. V _{OUT} is proportional to V _{SENSE} . Output impedance is approximately 12kΩ.

Detailed Description

The MAX4073 high-side current-sense amplifier features a +2V to +28V input common-mode range that is independent of supply voltage. This feature allows the monitoring of current out of a battery as low as +2V and also enables high-side current sensing at voltages greater than the supply voltage (V_{CC}).

The MAX4073 operates as follows: current from the source flows through R_{SENSE} to the load (Figure 1). Since the internal-sense amplifier's inverting input has high impedance, negligible current flows through R_{G2} (neglecting the input bias current). Therefore, the sense amplifier's inverting-input voltage equals V_{SOURCE} - (I_{LOAD})(R_{SENSE}). The amplifier's open-loop gain forces its noninverting input to the same voltage as the inverting input. Therefore, the drop across R_{G1} equals (I_{LOAD})(R_{SENSE}). Since I_{RG1} flows through R_{G1}, I_{RG1} = (I_{LOAD})(R_{SENSE}) / R_{G1}. The internal current mirror multiplies I_{RG1} by a current gain factor, β, to give I_{RGD} = β × I_{RG1}. Solving I_{RGD} = β × (I_{LOAD})(R_{SENSE}) / R_{G1}. Assuming infinite output impedance, V_{OUT} = (I_{RGD})(R_{GD}). Substituting in for I_{RGD} and rearranging, V_{OUT} = β × (R_{GD} / R_{G1})(R_{SENSE} × I_{LOAD}). The parts gain equals β × R_{GD} / R_{G1}. Therefore, V_{OUT} = (GAIN) (R_{SENSE}) (I_{LOAD}), where GAIN = 20V/V for MAX4073T, GAIN = 50V/V for MAX4073F, and GAIN = 100V/V for MAX4073H.

Set the full-scale output range by selecting R_{SENSE} and the appropriate gain version of the MAX4073.

Applications Information

Recommended Component Values

The MAX4073 senses a wide variety of currents with different sense resistor values. Table 1 lists common resistor values for typical operation of the MAX4073.

Choosing R_{SENSE}

To measure lower currents more accurately, use a large value for R_{SENSE}. The larger value develops a

Figure 1. Functional Diagram

higher-sense voltage that reduces offset voltage errors of the internal op amp. Typical sense voltages range between 10mV and 150mV.

In applications monitoring very high currents, R_{SENSE} must be able to dissipate the I²R losses. If the resistor's rated power dissipation is exceeded, its value may drift or it may fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings (±5V).

If I_{SENSE} has a large high-frequency component, minimize the inductance of R_{SENSE}. Wire-wound resistors have the highest inductance, metal-film resistors are

Low-Cost, SC70, Voltage-Output, High-Side Current-Sense Amplifier

somewhat better, and low-inductance metal-film resistors are best suited for these applications.

For $V_{SENSE} = 100\text{mV}$, full-scale output voltage can be 2V, 5V, or 10V depending on the gain. For proper operation, ensure V_{CC} exceeds the full-scale output voltage by 1.2V (see Output High Voltage ($V_{CC} - V_{OH}$) vs. Temperature in the *Typical Operating Characteristics*).

Using a PCB Trace as R_{SENSE}

If the cost of R_{SENSE} is an issue and accuracy is not critical, use the alternative solution shown in Figure 2. This solution uses copper PC board traces to create a sense resistor. The resistivity of a 0.1-inch-wide trace of 2-ounce copper is approximately $30\text{m}\Omega/\text{ft}$. The resistance-temperature coefficient of copper is fairly high (approximately $0.4\%/^{\circ}\text{C}$), so systems that experience a wide temperature variance must compensate for this effect. In addition, do not exceed the maximum power dissipation of the copper trace.

For example, the MAX4073T (with a maximum load current of 10A and an R_{SENSE} of $5\text{m}\Omega$) creates a full-scale V_{SENSE} of 50mV that yields a maximum V_{OUT} of 1V. R_{SENSE} in this case requires about 2 inches of 0.1 inch-wide copper trace.

Output Impedance

The output of the MAX4073 is a current source driving a $12\text{k}\Omega$ resistance. Resistive loading added to OUT reduces the output gain of the MAX4073. To minimize output errors for most applications, connect OUT to a high-impedance input stage. When output buffering is required, choose an op amp with a common-mode input range and an output voltage swing that includes ground when operating with a single supply. The op amp's supply voltage range should be at least as high as any voltage the system may encounter.

The percent error introduced by output loading is determined with the following formula:

$$\%_{\text{ERROR}} = 100 \left(\frac{R_{\text{LOAD}}}{12\text{k}\Omega + R_{\text{LOAD}}} - 1 \right)$$

where R_{LOAD} is the external load applied to OUT.

Current Source Circuit

Figure 3 shows a block diagram using the MAX4073 with a switching regulator to make a current source.
