Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

1 Summary of Features

The XC835/836 has the following features:

- High-performance XC800 Core
 - compatible with standard 8051 processor
 - two clocks per machine cycle architecture (for memory access without wait state)
 - two data pointers
- On-chip memory
 - 8 Kbytes of Boot ROM, Library ROM and User routines
 - 256 bytes of RAM
 - 256 bytes of XRAM
 - 4/8 Kbytes of Flash (includes memory protection strategy)
- I/O port supply at 2.5 V - 5.5 V and core logic supply at 2.5 V (generated by embedded voltage regulator)

Figure 1 XC835/836 Functional Units

- Power-on reset generation
- Brownout detection for IO supply and core logic supply
- 48 MHz on-chip OSC for clock generation
 - Loss-of-Clock detection

(more features on next page)

Summary of Features

Features: (continued)

- Power saving modes
 - idle mode
 - power-down mode with wake-up capability via real-time clock event
 - clock gating control to each peripheral
- Programmable 16-bit Watchdog Timer (WDT) running on independent oscillator with programmable window feature for refresh operation and warning prior to overflow
- Three general purpose I/O ports
 - 4 high current I/O
 - 2 high sink I/O
 - Up to 25 pins as digital I/O
 - Up to 8 pins as digital/analog input
- Up to 8 channels, 10-bit A/D Converter
 - support up to 7 differential input channel
 - results filtering by data reduction or digital low-pass filter, for up to 13-bit results
- Up to 8 channels, Out of range comparator
- Three 16-bit timers
 - Timer 0 and Timer 1 (T0 and T1)
 - Timer 2 (T2)
- Real-time clock with 32.768 kHz crystal pad
- 16-bit Vector Computer for Field-Oriented Control (FOC)
 - Multiplication/Division Unit (MDU) for arithmetic calculation
 - CORDIC Unit for trigonometric calculation
- Capture and Compare unit for PWM signal generation (CCU6)
- A full-duplex or half-duplex serial interface (UART)
- Synchronous serial channel (SSC)
- Inter-IC (IIC) serial interface
- LED and Touch-sense Controller (LEDTSCU)
- Software libraries to support fixed-point control and EEPROM emulation
- On-chip debug support via single pin DAP interface (SPD)
- Packages:
 - PG-DSO-24
 - PG-TSSOP-28
- Temperature range T_A :
 - SAF (-40 to 85 °C)
 - SAK (-40 to 125 °C)

Summary of Features
XC835/836 Variant Devices

The XC835/836 product family features devices with different configurations, program memory sizes, packages options and temperature profiles, to offer cost-effective solutions for different application requirements.

The list of XC835/836 device configurations are summarized in **Table 1**. The type of packages available are DSO-24 for XC835 and TSSOP-28 for XC836.

Table 1 Device Configuration

Ordering Information

The ordering code for Infineon Technologies microcontrollers provides an exact reference to the required product. This ordering code identifies:

- The derivative itself, i.e. its function set, the temperature range, and the supply voltage
- The package and the type of delivery

For the available ordering codes for the XC835/836, please refer to your responsible sales representative or your local distributor.

2.5 Memory Organization

The XC835/836 CPU operates in the following five address spaces:

- 8 Kbytes of Boot ROM, Library ROM and User routines
- 256 bytes of internal RAM
- 256 bytes of XRAM
(XRAM can be read/written as program memory or external data memory)
- A 128-byte Special Function Register area
- 4/8 Kbytes of Flash

Figure 6 illustrates the memory address spaces of the 4 Kbyte Flash devices. **Figure 7** illustrates the memory address spaces of the 8 Kbyte Flash devices.

2.6 JTAG ID

JTAG ID register is a read-only register located inside the JTAG module, and is used to recognize the device(s) connected to the JTAG interface. Its content is shifted out when INSTRUCTION register contains the IDCODE command (opcode 04_H), and the same is also true immediately after reset.

The JTAG ID register contents for the XC835/836 Flash devices are given in [Table 4](#).

Table 4 JTAG ID Summary

Device Type	Device Name	JTAG ID
Flash	XC835*-2FG	101B A083 _H
	XC836*-2FR	
	XC836*-1FR	101B B083 _H

Note: The asterisk () above denotes all possible device configurations.*

2.7 Chip Identification Number

The XC835/836 identity (ID) register is located at Page 1 of address B3_H. The value of ID register is 59_H. However, for easy identification of product variants, the Chip Identification Number, which is a unique number assigned to each product variant, is available. The differentiation is based on the product and variant type information.

Two methods are provided to read a device's Chip Identification number:

- In-application subroutine, GET_CHIP_INFO
- Boot-loader (BSL) mode A

Table 5 lists the Chip Identification numbers of XC835/836 device variants.

Table 5 Chip Identification Number

Product Variant	Chip Identification Number

3 Electrical Parameters

Chapter 3 provides the characteristics of the electrical parameters which are implementation-specific for the XC835/836.

3.1 General Parameters

The general parameters are described here to aid the users in interpreting the parameters mainly in **Section 3.2** and **Section 3.3**.

3.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the XC835/836 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are indicated by the abbreviations in the "Symbol" column:

- **CC**
 - These parameters indicate **C**ontroller **C**haracteristics, which are distinctive features of the XC835/836 and must be regarded for a system design.
- **SR**
 - These parameters indicate **S**ystem **R**equirements, which must be provided by the microcontroller system in which the XC835/836 is designed in.

3.1.2 Absolute Maximum Rating

Maximum ratings are the extreme limits to which the XC835/836 can be subjected to without permanent damage.

Table 6 Absolute Maximum Rating Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.		
Ambient temperature	T_A	-40	125	°C	under bias
Storage temperature	T_{ST}	-65	150	°C	–
Junction temperature	T_J	-40	150	°C	under bias
Voltage on power supply pin with respect to V_{SS}	V_{DDP}	-0.5	6	V	
Maximum current per pin for P1[3:0]	I_M	-115	115	mA	
Input current on any pin during overload condition	I_{IN}	-10	10	mA	
Absolute sum of all input currents during overload condition	$\Sigma I_{IN} $	–	50	mA	

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ($V_{IN} > V_{DDP}$ or $V_{IN} < V_{SS}$) the voltage on V_{DDP} pin with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

3.1.3 Operating Condition

The following operating conditions must not be exceeded in order to ensure correct operation of the XC835/836. All parameters mentioned in the following tables refer to these operating conditions, unless otherwise noted.

Table 7 Operating Condition Parameters

Parameter	Symbol	Limit Values		Unit	Notes/ Conditions
		Min.	Max.		
Digital power supply voltage	V_{DDP}	3.0	5.5	V	
		2.5	3.0	V	¹⁾
Digital core supply voltage ²⁾	V_{DDC}	2.3	2.7	V	
CPU Clock Frequency	f_{CCLK}	22.5	25.6	MHz	typ. 24 MHz
		7.5	8.5	MHz	typ. 8 MHz
Ambient temperature	T_A	-40	85	°C	SAF-XC835/836...
		-40	125	°C	SAK-XC836...

1) In this voltage range, limited operations are available in active mode. Operations in power save modes are fully supported.

2) V_{DDC} is supplied by the on-chip EVR. The limits are verified by design and production testing.

3.2 DC Parameters

The electrical characteristics of the DC Parameters are detailed in this section.

3.2.1 Input/Output Characteristics

Table 8 provides the characteristics of the input/output pins of the XC835/836.

Table 8 Input/Output Characteristics (Operating Conditions apply)

- 1) Not subjected to production test, verified by design/characterization. Hysteresis is implemented to avoid meta stable states and switching due to internal ground bounce. It cannot be guaranteed that it suppresses switching due to external system noise.
- 2) An additional error current (I_{INJ}) will flow if an overload current flows through an adjacent pin.
- 3) Over current detection is available for 5V application only.
- 4) Not subjected to production test, verified by design/characterization.
- 5) Not subjected to production test, verified by design/characterization. However, for applications with strict low power-down current requirements, it is mandatory that no active voltage source is supplied at any GPIO pin when V_{DDP} is powered off.

3.2.2 Supply Threshold Characteristics

Table 9 provides the characteristics of the supply threshold in the XC835/836.

1) Detection is enabled via SDCON register in active mode. It is automatically disabled in power down mode. Detection should be disabled for V_{DDP} less than maximum of V_{DDPPW} .

2) This parameter has a hysteresis of 50 mV.

3) Detection is enabled via SDCON register. Detection must be disabled for application with V_{DDP} less than the specified values.

4) V_{DDPSRR} and V_{DDCSRR} must be met before the system reset is released.

5) Detection is enabled via SDCON register in active mode. It is automatically disabled in power down mode.

3.2.3 ADC Characteristics

The values in **Table 10** are given for an analog power supply of 5.0 V. The ADC can be used with an analog power supply down to 3 V. But in this case, analog parameters may show a reduced performance. In the reduced voltage mode ($2.5\text{ V} < V_{DDP} < 3\text{ V}$), the ADC is not recommended to be used.

1) 1.2 V at $V_{DDP} = 3.0\text{ V}$.

2) Not subject to production test, verified at CPU clock ($f_{SCLK, CCLK}$) = 8 MHz, $T_A = +25\text{ }^\circ\text{C}$ and $V_{DDP} = 5\text{ V}$.

3) TUE is tested at $V_{AREF} = V_{DDP} = 5.0\text{ V}$ and CPU clock ($f_{SCLK, CCLK}$) = 8 MHz.

4) Not subject to production test, verified by design/characterization.

5) If a reduced positive reference voltage is used, TUE will increase. If the positive reference is reduced by a factor of K, the TUE will increased by 1/K. Example:K = 0.8, 1/K = 1.25; 1.25 X TUE = 2.5 LSB10.

6) The sampling capacity of the conversion C-Network is pre-charged to $V_{AREF}/2$ before connecting the input to the C-Network. Because of the parasitic elements, the voltage measured at ANx is lower than $V_{AREF}/2$.

3.2.3.1 ADC Conversion Timing

Conversion time, $t_C = t_{ADC} \times (1 + r \times (3 + n + STC))$, where

- $r = CTC + 3$,
- CTC = Conversion Time Control (GLOBCTR.CTC),
- STC = Sample Time Control (INPCR0.STC),
- $n = 8$ or 10 (for 8-bit and 10-bit conversion respectively),
- $t_{ADC} = 1 / f_{ADC}$

3.2.3.2 Out of Range Comparator Characteristics

3.2.4 Flash Memory Parameters

The XC835/836 is delivered with all Flash sectors erased (read all zeros).

The data retention time of the XC835/836's Flash memory (i.e. the time after which stored data can still be retrieved) depends on the number of times the Flash memory has been erased and programmed.

Note: Flash memory parameters are not subject to production test but verified by design and/or characterization.

Table 12 Flash Timing Parameters (Operating Conditions apply)

Parameter	Symbol	CC	Limit Values			Unit	Remarks
			Min.	Typ.	Max.		
Read access time (per byte)	t_{ACC}	CC	–	125	–	ns	
Programming time (per wordline)	t_{PR}	CC	–	2.2	–	ms	
Erase time (one or more sectors)	t_{ER}	CC	–	120	–	ms	
Flash wait states	$N_{WSFLASH}$	CC	0				CPU clock = 8 MHz
			1				CPU clock = 24 MHz

Table 13 Flash Data Retention and Endurance (Operating Conditions apply)

Retention	Endurance ¹⁾	Size	Remarks
20 years	1,000 cycles	up to 8 Kbytes	
5 years	10,000 cycles	1 Kbyte	
2 years	70,000 cycles	512 bytes	
2 years	100,000 cycles	128 bytes	

1) One cycle refers to the programming of all wordlines in a sector and erasing of sector. The Flash endurance data specified in **Table 13** is valid only if the following conditions are fulfilled:

- the maximum number of erase cycles per Flash sector must not exceed 100,000 cycles.
- the maximum number of erase cycles per Flash bank must not exceed 300,000 cycles.
- the maximum number of program cycles per Flash bank must not exceed 2,500,000 cycles.

Table 14 Emulated Flash Data Retention and Endurance based on EEPROM Emulation ROM Library (Operating Conditions apply)

Retention	Endurance ¹⁾	Emulation Size	Remarks
2 years	1,600,000 cycles	31 bytes	
2 years	1,400,000 cycles	62 bytes	
2 years	1,200,000 cycles	93 bytes	
2 years	1,000,000 cycles	124 bytes	

1) These values show the maximum endurance. Maximum endurance is the maximum possible unique data write if each data update is only 31 bytes. Minimum endurance cycle is the maximum possible unique data write if each data update is the same as the emulation size. The minimum endurance cycle can be calculated using the formulae [(max. endurance)*(31)/(emulation size)].

3.2.5 Power Supply Current

Table 15 provides the characteristics of the power supply current in the XC835/836.

- 1) The typical I_{DDP} values are measured at $T_A = +25^\circ\text{C}$ and $V_{DDP} = 5\text{ V}$ and 3.3 V .
- 2) The maximum I_{DDP} values are measured under worst case conditions ($T_A = +125^\circ\text{C}$ and $V_{DDC} = 5\text{ V}$) unless stated otherwise.
- 3) I_{DDP} (active mode) is measured with: CPU clock and input clock to all peripherals running at 24 MHz (CLKMODE=0).
- 4) I_{DDP} (active mode) is measured with: CPU clock and input clock to all peripherals running at 8 MHz (CLKMODE=1).
- 5) This value is based on the maximum load capacity of EVR during $V_{DDP} = 2.5\text{ V}$. Not subject to production test, verified by design/characterisation.
- 6) I_{DDPI} (idle mode) is measured with: CPU clock disabled, watchdog timer disabled, input clock to all peripherals enabled and running at 24 MHz (CLKMODE=0).
- 7) I_{PDP1} , I_{PDP2} , I_{PDP3} and I_{PDP4} is measured at 5 V and 3.3 V with: wake-up port is programmed to be input with either internal pull devices enabled or driven externally to ensure no floating inputs.
- 8) Not subject to production test, verified by design/characterisation.
- 9) I_{PDP1} , I_{PDP2} , I_{PDP3} and I_{PDP4} has a maximum values of 120 uA at $T_A = +125^\circ\text{C}$.

Electrical Parameters

Table 16 shows the maximum active current within the device in the reduced voltage condition of $2.5\text{ V} < V_{DDP} < 3.0\text{ V}$. The active current consumption needs to be below the specified values as according to the V_{DDP} voltage. If the conditions are not met, a brownout reset may be triggered.

Table 16 Active Current Consumption in Reduced Voltage Condition

1) Modules that are controllable by programming the register PMCON1.

2) Not subject to production test, verified by design/characterisation.

3) Baseload current is measured when the device is running in user mode with an endless loop in the flash memory. All modules in register PMCON1 are disabled.

4) ADC active current is measured with: module enable, ADC analog clock at 8MHz, running in parallel conversion request in autoscan mode for 4 channels

5) SSC active current is measured with: module enabled, running in loop back mode at a baud rate of 1 MBaud

6) CCU6 active current is measured with: module enabled, all timers running in 8 MHz, 6 PWM outputs are generated.

Electrical Parameters

- 7) Timer 2 active current is measured with: module enabled, timer running in 8 MHz
- 8) MDU active current is measured with: module enabled, division operation was performed.
- 9) CORDIC active mode is measured with: module enabled, circular mode was selected for the calculation.
- 10) LEDTSCU active current is measured with: module enabled, counter running in 8 MHz.
- 11) IIC active current is measured with: module enabled, performing a master transmit with the master clock running at 400 KHz.

3.3 AC Parameters

The electrical characteristics of the AC Parameters are detailed in this section.

3.3.1 Testing Waveforms

The testing waveforms for rise/fall time, output delay and output high impedance are shown in [Figure 11](#), [Figure 12](#) and [Figure 13](#).

1) The thermal resistances between the case and the ambient (R_{TCA}), the lead and the ambient (R_{TLA}) are to be combined with the thermal resistances between the junction and the case (R_{TJC}), the junction and the lead (R_{TJL}) given above, in order to calculate the total thermal resistance between the junction and the ambient (R_{TJA}). The thermal resistances between the case and the ambient (R_{TCA}), the lead and the ambient (R_{TLA}) depend on the external system (PCB, case) characteristics, and are under user responsibility.

The junction temperature can be calculated using the following equation: $T_J = T_A + R_{TJA} \times P_D$, where the R_{TJA} is the total thermal resistance between the junction and the ambient. This total junction ambient resistance R_{TJA} can be obtained from the upper four partial thermal resistances, by

- simply adding only the two thermal resistances (junction lead and lead ambient), or
- by taking all four resistances into account, depending on the precision needed.

4.2 Package Outline

Figure 17 and Figure 18 shows the package outlines of the XC835 (DSO-24-1) and XC836 (TSSOP-28-1 and TSSOP-28-12) devices respectively.

4.3 Quality Declaration

Table 25 shows the characteristics of the quality parameters in the XC835/836.

Table 25 Quality Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.		
Operation Lifetime when the device is used at the three stated T_J ¹⁾	t_{OP1}	-	1500	hours	$T_J = 150^\circ\text{C}$
		-	15000	hours	$T_J = 110^\circ\text{C}$
		-	1500	hours	$T_J = -40^\circ\text{C}$
Operation Lifetime when the device is used at the stated T_J ¹⁾	t_{OP2}	-	131400	hours	$T_J = 27^\circ\text{C}$
ESD susceptibility according to Human Body Model (HBM)	V_{HBM}	-	2000	V	Conforming to EIA/JESD22-A114-B ²⁾
ESD susceptibility according to Charged Device Model (CDM) pins	V_{CDM}	-	500	V	Conforming to JESD22-C101-C ²⁾

1) This lifetime refers only to the time when device is powered-on.

2) Not all parameters are 100% tested, but are verified by design/characterisation and test correlation.
