

## 5 kV LED EMULATOR INPUT, 4.0 A ISOLATED GATE DRIVERS

### Features

- Pin-compatible, drop-in upgrades for popular high speed opto-coupled gate drivers
- Low power diode emulator simplifies design-in process
- 0.6 and 4.0 Amp peak output drive current
- Rail-to-rail output voltage
- Performance and reliability advantages vs. opto-drivers
  - Resistant to temperature and age
  - 10x lower FIT rate for longer service life
  - 14x tighter part-to-part matching
  - Higher common-mode transient immunity: >50 kV/μs typical
- Robust protection features
  - Multiple UVLO ordering options (5, 8, and 12 V) with hysteresis
- 60 ns propagation delay, independent of input drive current
- Wide V<sub>DD</sub> range: 6.5 to 30 V
- Up to 5000 V<sub>RMS</sub> isolation
- 10 kV surge withstand capability
- AEC-Q100 qualified
- Wide operating temperature range
  - -40 to +125 °C
- RoHS-compliant packages
  - SOIC-8 (Narrow body)
  - DIP8 (Gull-wing)
  - SDIP6 (Stretched SO-6)
- Automotive-grade OPNs available
  - AIAG compliant PPAP documentation support
  - IMDS and CAMDS listing support

### Applications

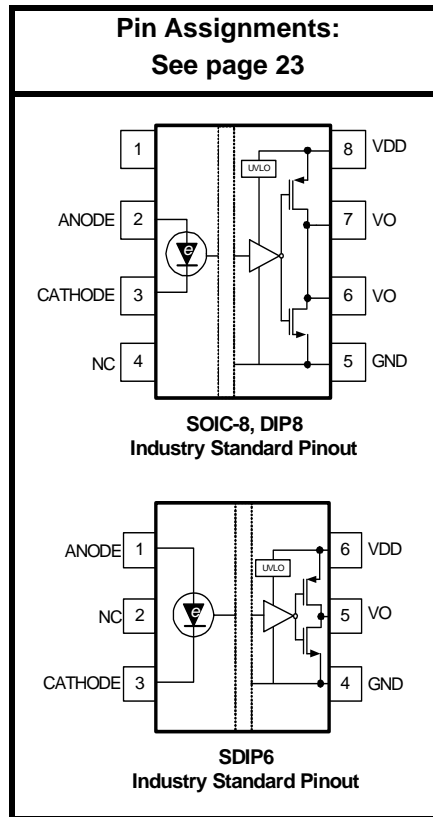

- IGBT/ MOSFET gate drives
- Industrial, HEV and renewable energy inverters
- AC, Brushless, and DC motor controls and drives
- Variable speed motor control in consumer white goods
- Isolated switch mode and UPS power supplies

### Safety Regulatory Approvals

- UL 1577 recognized
  - Up to 5000 V<sub>rms</sub> for 1 minute
- CSA component notice 5A approval
  - IEC 60950-1, 60601-1 (reinforced insulation)
- VDE certification conformity
  - VDE0884-10 (basic/reinforced insulation)
- CQC certification approval
  - GB4943.1

### Description

The Si826x isolators are pin-compatible, drop-in upgrades for popular opto-coupled gate drivers, such as 0.6 A ACPL-0302/3020, 2.5 A HCPL-3120/ACPL-3130, HCNW3120/3130, and similar opto-drivers. The devices are ideal for driving power MOSFETs and IGBTs used in a wide variety of inverter and motor control applications. The Si826x isolated gate drivers utilize Skyworks Solutions' proprietary silicon isolation technology, supporting up to 5.0 kV<sub>RMS</sub> withstand voltage per UL1577 and 10kV surge protection per VDE 0884-10. This technology enables higher-performance, reduced variation with temperature and age, tighter part-to-part matching, and superior common-mode rejection compared to opto-coupled gate drivers. While the input circuit mimics the characteristics of an LED, less drive current is required, resulting in higher efficiency. Propagation delay time is independent of input drive current, resulting in consistently short propagation times, tighter unit-to-unit variation, and greater input circuit design flexibility. As a result, the Si826x series offers longer service life and dramatically higher reliability compared to opto-coupled gate drivers. Automotive Grade is available for certain part numbers. These products are built using automotive-specific flows at all steps in the manufacturing process to ensure the robustness and low defectivity required for automotive applications.

Patent pending

## 1. Electrical Specifications

**Table 1. Recommended Operating Conditions**

Parameter	Symbol	Min	Typ	Max	Unit
Supply Voltage	$V_{DD}$	6.5	—	30	V
Input Current	$I_{F(ON)}$ (see Figure 1)	6	—	30	mA
Operating Temperature (Ambient)	$T_A$	-40	—	125	°C

**Table 2. Electrical Characteristics <sup>1</sup>**

$V_{DD} = 15\text{ V}$  or  $30\text{ V}$ ,  $GND = 0\text{ V}$ ,  $I_F = 6\text{ mA}$ ,  $T_A = -40$  to  $+125\text{ °C}$ ; typical specs at  $25\text{ °C}$ ;  $T_J = -40$  to  $+140\text{ °C}$

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
<b>DC Parameters</b>						
Supply Voltage <sup>2</sup>	$V_{DD}$	$(V_{DD} - GND)$	6.5	—	30	V
Supply Current (Output High)	$I_{DD}$	$I_F = 10\text{ mA}$	—	1.8	2.4	mA
		$V_{DD} = 15\text{ V}$ $V_{DD} = 30\text{ V}$	—	2.0	2.7	mA
Supply Current (Output Low)	$I_{DD}$	$V_F = 0\text{ V}$ ; $I_F = 0\text{ mA}$	—	1.5	2.1	mA
		$V_{DD} = 15\text{ V}$ $V_{DD} = 30\text{ V}$	—	1.7	2.4	mA
Input Current Threshold	$I_{F(TH)}$		—	—	3.6	mA
Input Current Hysteresis	$I_{HYS}$		—	0.34	—	mA
Input Forward Voltage (OFF)	$V_{F(OFF)}$	Measured at ANODE with respect to CATHODE.	—	—	1	V
Input Forward Voltage (ON)	$V_{F(ON)}$	Measured at ANODE with respect to CATHODE.	1.6	—	2.8	V
Input Capacitance	$C_I$	$f = 100\text{ kHz}$ ,	—	15	—	pF
		$V_F = 0\text{ V}$ , $V_F = 2\text{ V}$	—	15	—	
Output Resistance High (Source) <sup>3</sup>	$R_{OH}$	Si826xAxx devices	—	15	—	Ω
		Si826xBxx devices ( $I_{OH} = -1\text{ A}$ )	—	2.6	5.1	
Output Resistance Low (Sink) <sup>3</sup>	$R_{OL}$	Si826xAxx devices	—	5	—	
		Si826xBxx devices ( $I_{OL} = 2\text{ A}$ )	—	0.8	2.0	

**Notes:**

1. See "8.Ordering Guide" on page 24 for more information.
2. Minimum value of  $(V_{DD} - GND)$  decoupling capacitor is  $1\text{ }\mu\text{F}$ .
3. Both  $V_O$  pins are required to be shorted together for 4.0 A compliance.
4. When performing this test, it is recommended that the DUT be soldered down to the PCB to reduce parasitic inductances, which may cause over-stress conditions due to excessive ringing.
5. Guaranteed by characterization.

**Table 2. Electrical Characteristics (Continued)<sup>1</sup>**

$V_{DD} = 15\text{ V or }30\text{ V}$ ,  $GND = 0\text{ V}$ ,  $I_F = 6\text{ mA}$ ,  $T_A = -40\text{ to }+125\text{ }^\circ\text{C}$ ; typical specs at  $25\text{ }^\circ\text{C}$ ;  $T_J = -40\text{ to }+140\text{ }^\circ\text{C}$

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Output High Current (Source) <sup>3,4</sup>	$I_{OH}$	Si826xAxx devices ( $I_F = 0$ ), ( $t_{PW\_IOH} \leq 250\text{ ns}$ ) (see Figure 3)	—	0.4	—	A
		Si826xBxx devices ( $I_F = 0$ ), ( $t_{PW\_IOH} \leq 250\text{ ns}$ ), ( $V_{DD} - V_O = 7.5\text{ V}$ ) (see Figure 3)	0.5	1.8	—	
Output Low Current (Sink) <sup>3,4</sup>	$I_{OL}$	Si826xAxx devices ( $I_F = 10\text{ mA}$ ), ( $t_{PW\_IOL} \leq 250\text{ ns}$ ) (see Figure 2)	—	0.6	—	A
		Si826xBxx devices ( $I_F = 10\text{ mA}$ ), ( $t_{PW\_IOL} \leq 250\text{ ns}$ ), ( $V_O - GND = 4.2\text{ V}$ ) (see Figure 2)	1.2	4.0	—	
High-Level Output Voltage	$V_{OH}$	Si826xAxx devices ( $I_{OUT} = -100\text{ mA}$ )	—	$V_{DD} - 0.4$	—	V
		Si826xBxx devices ( $I_{OUT} = -100\text{ mA}$ )	$V_{DD} - 0.5$	$V_{DD} - 0.25$	—	
		Si826xBxx devices ( $I_{OUT} = 0\text{ mA}$ ), ( $I_F = 0\text{ mA}$ )	—	$V_{DD}$	—	
Low-Level Output Voltage	$V_{OL}$	Si826xAxx devices ( $I_{OUT} = 100\text{ mA}$ ), ( $I_F = 10\text{ mA}$ )	—	320	—	mV
		Si826xBxx devices ( $I_{OUT} = 100\text{ mA}$ ), ( $I_F = 10\text{ mA}$ )	—	80	200	
UVLO Threshold + (Si826xxAx mode)	$V_{DDUV+}$	See Figure 10 on page 17. $V_{DD}$ rising	5	5.6	6.3	V
UVLO Threshold – (Si826xxAx mode)	$V_{DDUV-}$	See Figure 10 on page 17. $V_{DD}$ falling	4.7	5.3	6.0	V

**Notes:**

1. See "8.Ordering Guide" on page 24 for more information.
2. Minimum value of ( $V_{DD} - GND$ ) decoupling capacitor is  $1\text{ }\mu\text{F}$ .
3. Both  $V_O$  pins are required to be shorted together for 4.0 A compliance.
4. When performing this test, it is recommended that the DUT be soldered down to the PCB to reduce parasitic inductances, which may cause over-stress conditions due to excessive ringing.
5. Guaranteed by characterization.

## 2. Regulatory Information

**Table 3. Regulatory Information\***

<b>CSA</b>	
The Si826x is certified under CSA Component Acceptance Notice 5A. For more details, see Master Contract Number 232873.	
60950-1: Up to 1000 V <sub>RMS</sub> reinforced insulation working voltage; up to 1000 V <sub>RMS</sub> basic insulation working voltage.	
60601-1: Up to 250 V <sub>RMS</sub> working voltage and 2 MOPP (Means of Patient Protection).	
<b>VDE</b>	
The Si826x is certified according to VDE0884-10. For more details, see certificate 40037519.	
VDE0884 Part 10: Up to 1414 V <sub>peak</sub> for reinforced insulation working voltage.	
<b>UL</b>	
The Si826x is certified under UL1577 component recognition program. For more details, see File E257455.	
Rated up to 5000 V <sub>RMS</sub> isolation voltage for basic protection.	
<b>CQC</b>	
The Si826x is certified under GB4943.1-2011. For more details, see certificates CQC15001121282 and CQC15001121283.	
Rated up to 1000 V <sub>RMS</sub> reinforced insulation working voltage; up to 1000 V <sub>RMS</sub> basic insulation working voltage.	
<p><b>*Note:</b> Regulatory Certifications apply to 3.75 kV<sub>RMS</sub> rated devices which are production tested to 4.5 kV<sub>RMS</sub> for 1 sec.            Regulatory Certifications apply to 5.0 kV<sub>RMS</sub> rated devices which are production tested to 6.0 kV<sub>RMS</sub> for 1 sec.            For more information, see "8.Ordering Guide" on page 24.</p>

### 3. Functional Description

#### 3.1. Theory of Operation

The Si826x is a functional upgrade for popular opto-isolated drivers, such as the Avago HPCL-3120, HPCL-0302, Toshiba TLP350, and others. The operation of an Si826x channel is analogous to that of an opto coupler, except an RF carrier is modulated instead of light. This simple architecture provides a robust isolated data path and requires no special considerations or initialization at start-up. The Si826x also includes a noise filter that suppresses propagation of any pulse narrower than 15 ns. A simplified block diagram for the Si826x is shown in Figure 8.

Figure 8. Simplified Channel Diagram

## 4. Technical Description

### 4.1. Device Behavior

Truth tables for the Si826x are summarized in Table 10.

**Table 10. Si826x Truth Table Summary\***

Input	V <sub>DD</sub>	V <sub>O</sub>
OFF	> UVLO	LOW
OFF	< UVLO	LOW
ON	> UVLO	HIGH
ON	< UVLO	LOW

**\*Note:** This truth table assumes V<sub>DD</sub> is powered. If V<sub>DD</sub> is below UVLO, see "4.3. Under Voltage Lockout (UVLO)" on page 17 for more information.

### 4.2. Device Startup

Output V<sub>O</sub> is held low during power-up until V<sub>DD</sub> rises above the UVLO+ threshold for a minimum time period of t<sub>START</sub>. Following this, the output is high when the current flowing from anode to cathode is > I<sub>F(ON)</sub>. Device startup, normal operation, and shutdown behavior is shown in Figure 9.

**Figure 9. Si826x Operating Behavior (I<sub>F</sub> ≥ I<sub>F(MIN)</sub> when V<sub>F</sub> ≥ V<sub>F(MIN)</sub>)**

### 4.3. Under Voltage Lockout (UVLO)

The UVLO circuit unconditionally drives  $V_O$  low when  $V_{DD}$  is below the lockout threshold. Referring to Figures 10 through 12, upon power up, the Si826x is maintained in UVLO until  $V_{DD}$  rises above  $V_{DD_{UV+}}$ . During power down, the Si826x enters UVLO when  $V_{DD}$  falls below the UVLO threshold plus hysteresis (i.e.,  $V_{DD} \leq V_{DD_{UV+}} - V_{DD_{HYS}}$ ).

Figure 10. Si826xxAx UVLO Response (5 V)

Figure 12. Si826xxCx UVLO Response (12 V)

Figure 11. Si826xxBX UVLO Response (8 V)

## 5. Applications

The following sections detail the input and output circuits necessary for proper operation. Power dissipation and layout considerations are also discussed.

### 5.1. Input Circuit Design

Opto driver manufacturers typically recommend the circuits shown in Figures 13 and 14. These circuits are specifically designed to improve opto-coupler input common-mode rejection and increase noise immunity.

**Figure 13. Si826x Input Circuit**

**Figure 14. High CMR Si826x Input Circuit**

The optically-coupled driver circuit of Figure 13 turns the LED on when the control input is high. However, internal capacitive coupling from the LED to the power and ground conductors can momentarily force the LED into its off state when the anode and cathode inputs are subjected to a high common-mode transient. The circuit shown in Figure 14 addresses this issue by using a value of R1 sufficiently low to overdrive the LED, ensuring it remains on during an input common-mode transient. Q1 shorts the LED off in the low output state, again increasing common-mode transient immunity.

Some opto driver applications recommend reverse-biasing the LED when the control input is off to prevent coupled noise from energizing the LED. The Si826x input circuit requires less current and has twice the off-state noise margin compared to opto couplers. However, high CMR opto coupler designs that overdrive the LED (see Figure 14) may require increasing the value of R1 to limit input current  $I_F$  to its maximum rating when using the Si826x. In addition, there is no benefit in driving the Si826x input diode into reverse bias when in the off state.

Consequently, opto coupler circuits using this technique should either leave the negative bias circuitry unpopulated or modify the circuitry (e.g., add a clamp diode or current limiting resistor) to ensure that the anode pin of the Si826x is no more than  $-0.3\text{ V}$  with respect to the cathode when reverse-biased.

New designs should consider the input circuit configurations of Figure 15, which are more efficient than those of Figures 13 and 14. As shown, S1 and S2 represent any suitable switch, such as a BJT or MOSFET, analog transmission gate, processor I/O, etc. Also, note that the Si826x input can be driven from the I/O port of any MCU or FPGA capable of sourcing a minimum of 6 mA (see Figure 15C). Additionally, note that the Si826x propagation delay and output drive do not significantly change for values of  $I_F$  between  $I_{F(\text{MIN})}$  and  $I_{F(\text{MAX})}$ .

Figure 15. Si826x Other Input Circuit Configurations

## 5.2. Output Circuit Design

GND can be biased at, above, or below ground as long as the voltage on  $V_{DD}$  with respect to GND is a maximum of 30 V.  $V_{DD}$  decoupling capacitors should be placed as close to the package pins as possible. The optimum values for these capacitors depend on load current and the distance between the chip and its power source. It is recommended that 0.1 and 10  $\mu\text{F}$  bypass capacitors be used to reduce high-frequency noise and maximize performance.

## 5.3. Layout Considerations

It is most important to minimize ringing in the drive path and noise on the  $V_{DD}$  lines. Care must be taken to minimize parasitic inductance in these paths by locating the Si826x as close as possible to the device it is driving. In addition, the  $V_{DD}$  supply and ground trace paths must be kept short. For this reason, the use of power and ground planes is highly recommended. A split ground plane system having separate ground and  $V_{DD}$  planes for power devices and small signal components provides the best overall noise performance.

## 5.4. Power Dissipation Considerations

Proper system design must assure that the Si826x operates within safe thermal limits across the entire load range. The Si826x total power dissipation is the sum of the power dissipated by bias supply current, internal switching losses, and power delivered to the load, as shown in Equation 1.

$$P_D = I_F \times V_F \times DC + V_{DD} \times [I_{DDQ} + (Q_d + C_L \times V_{DD}) \times f]$$

where:  $P_D$  is the total device power dissipation (W)

$I_F$  is the diode current (30 mA max)

$V_F$  is the diode anode to cathode voltage (2.8 V max)

DC is duty cycle (0.5 typical)

$V_{DD}$  is the driver-side supply voltage (30 V max)

$I_{DDQ}$  is the driver maximum bias current (2.5 mA)

$Q_d$  is 3 nC

$C_L$  is the load capacitance

$f$  is the switching frequency (Hz)

### Equation 1.

The maximum allowable power dissipation for the Si826x is a function of the package thermal resistance, ambient temperature, and maximum allowable junction temperature, as shown in Equation 2.

$$P_{Dmax} \leq \frac{T_{jmax} - T_A}{\theta_{ja}}$$

where:

$P_{Dmax}$  is the maximum allowable power dissipation (W)

$T_{jmax}$  is the maximum junction temperature (140 °C)

$T_A$  is the ambient temperature (°C)

$\theta_{ja}$  is the package junction-to-air thermal resistance (110 °C/W)

### Equation 2.

Substituting values for  $P_{Dmax}$ ,  $T_{jmax}$ ,  $T_A$ , and  $\theta_{ja}$  into Equation 2 results in a maximum allowable total power dissipation of 1.0 W. Note that the maximum allowable load is found by substituting this limit and the appropriate datasheet values from Table 2 on page 4 into Equation 1 and simplifying. Graphs are shown in Figures 16 and 18. All points along the load lines in these graphs represent the package dissipation-limited value of  $C_L$  for the corresponding switching frequency.

Figure 16. (SOIC-8, DIP8, SDIP6) Maximum Load vs. Switching Frequency (25 °C)

## 6. Pin Descriptions (SOIC-8, DIP8)

**Figure 17. Pin Configuration**

**Table 11. Pin Descriptions (SOIC-8, DIP8)**

Pin	Name	Description
1	NC*	No connect.
2	ANODE	Anode of LED emulator. $V_O$ follows the signal applied to this input with respect to the CATHODE input.
3	CATHODE	Cathode of LED emulator. $V_O$ follows the signal applied to ANODE with respect to this input.
4	NC*	No connect.
5	GND	External MOSFET source connection and ground reference for $V_{DD}$ . This terminal is typically connected to ground but may be tied to a negative or positive voltage.
6	$V_O$	Output signal. Both $V_O$ pins are required to be shorted together for 4.0 A compliance.
7	$V_O$	Output signal. Both $V_O$ pins are required to be shorted together for 4.0 A compliance.
8	$V_{DD}$	Output-side power supply input referenced to GND (30 V max).

**\*Note:** No Connect. These pins are not internally connected. To maximize CMTI performance, these pins should be connected to the ground plane.

## 7. Pin Descriptions (SDIP6)

**SDIP6**  
Industry Standard Pinout

**Figure 18. Pin Configuration**

**Table 12. Pin Descriptions (SDIP6)**

Pin	Name	Description
1	ANODE	Anode of LED emulator. $V_O$ follows the signal applied to this input with respect to the CATHODE input.
2	NC*	No connect.
3	CATHODE	Cathode of LED emulator. $V_O$ follows the signal applied to ANODE with respect to this input.
4	GND	External MOSFET source connection and ground reference for $V_{DD}$ . This terminal is typically connected to ground but may be tied to a negative or positive voltage.
5	$V_O$	Output signal.
6	$V_{DD}$	Output-side power supply input referenced to GND (30 V max).

**\*Note:** No Connect. These pins are not internally connected. To maximize CMTI performance, these pins should be connected to the ground plane.

**Notes:**

1. All packages are RoHS-compliant with peak solder reflow temperatures of 260 °C according to the JEDEC industry standard classifications.
2. “Si” and “SI” are used interchangeably.
3. AEC-Q100 qualified.

## 8.1. Automotive Grade OPNs

Automotive-grade devices are built using automotive-specific flows at all steps in the manufacturing process to ensure robustness and low defectivity. These devices are supported with AIAG-compliant Production Part Approval Process (PPAP) documentation, and feature International Material Data System (IMDS) and China Automotive Material Data System (CAMDS) listing. Qualifications are compliant with AEC-Q100, and a zero-defect methodology is maintained throughout definition, design, evaluation, qualification, and mass production steps.

**Table 14. Si826x Ordering Guide<sup>1,2,3</sup>**

New Ordering Part Number (OPN)	Ordering Options					
	Output Configuration	Cross Reference	UVLO Voltage	Insulation Rating	Temp Range	Pkg Type
Si8261BBC-AP	4.0 A driver	TLP 350 HCPL-3120	8 V	3.75 kVrms	–40 to +125 °C	DIP8/GW
Si8261BBC-AS	4.0 A driver	—	8 V	3.75 kVrms	–40 to +125 °C	SOIC-8
Si8261BCC-AS	4.0 A driver	—	12 V	3.75 kVrms	–40 to +125 °C	SOIC-8
Si8261BCD-AS	4.0 A driver	TLP 700F	12 V	5.0 kVrms	–40 to +125 °C	SDIP6

**Notes:**

1. All packages are RoHS-compliant with peak solder reflow temperatures of 260 °C according to the JEDEC industry standard classifications.
2. “Si” and “SI” are used interchangeably.
3. AEC-Q100 qualified
4. An “R” at the end of the part number denotes tape and reel packaging option.
5. Automotive-Grade devices (with an “-A” suffix) are identical in construction materials, topside marking, and electrical parameters to their Industrial-Grade (with a “-I” suffix) version counterparts. Automotive-Grade products are produced utilizing full automotive process flows and additional statistical process controls throughout the manufacturing flow. The Automotive-Grade part number is included on shipping labels.
6. Additional Ordering Part Numbers may be available in Automotive-Grade. Please contact your local Skyworks Solutions sales representative for further information.
7. In Chapter 15. Top Markings on page 35, the Manufacturing Code represented by either “RTTTTT” or “TTTTTT” contains as its first character a letter in the range N through Z to indicate Automotive-Grade.

## 9. Package Outline: 8-Pin Narrow Body SOIC

Figure 19 illustrates the package details for the Si826x in an 8-pin narrow-body SOIC package. Table 15 lists the values for the dimensions shown in the illustration.

**Figure 19. 8-Pin Narrow Body SOIC Package**

**Table 15. 8-Pin Narrow Body SOIC Package Diagram Dimensions**

Symbol	Millimeters	
	Min	Max
A	1.35	1.75
A1	0.10	0.25
A2	1.40 REF	1.55 REF

## 15.6. Top Marking Explanation

<b>Line 1 Marking:</b>	Device	Si826 = ISOdriver product series C = Input configuration 1 = Opto input type
<b>Line 2 Marking:</b>	Device Rating	I = Peak output current A = 0.6 A; B = 4.0 A U = UVLO level A = 5 V; B = 8 V; C = 12 V V = Isolation rating C = 3.75 kV; D = 5.0 kV
<b>Line 3 Marking:</b>	RTTTTT = Mfg Code	Manufacturing Code from the Assembly Purchase Order form. "R" indicates revision.
<b>Line 4 Marking:</b>	YY = Year WW = Work Week	Assigned by the Assembly House. Corresponds to the year and work week of the mold date.

## DOCUMENT CHANGE LIST

### Revision 0.9 to Revision 1.0

- Updated Table 2 on page 4.
- Added Figure 1 on page 7.
- Updated "3.1.Theory of Operation" on page 15.
- Updated Figures 10, 11, and 12 on page 17.
- Removed "5.5. Parametric Differences between Si826x and HCPL-0302 and HCPL-3120 Opto Drivers".

### Revision 1.0 to Revision 1.1

- Updated Figure 1 on page 7.
- Updated Ordering Guide Table 13 on page 24.
  - Removed references to moisture sensitivity levels from table note.

### Revision 1.1 to Revision 1.2

- Removed "Sampling" from Ordering Guide Table 13 on page 24.

### Revision 1.2 to Revision 1.3

- Updated Table 3 on page 9.
  - Added CQC certificate numbers.
- Updated Table 5 on page 10.
  - Updated Rated Mains Voltage for 1000 V<sub>RMS</sub> ratings.
- Updated Table 6 on page 10.
  - Removed V<sub>IOSM</sub> specification.
- Updated Table 9 on page 14.
  - Replaced I<sub>O</sub> with Peak Output Current I<sub>OPK</sub>.
- Updated Figure 13 on page 18.
- Updated Figure 14 on page 18.
- Updated Figure 15 on page 19.
- Changed V<sub>DD</sub> minimum throughout document to reflect 6.5 V, not 5 V, as normal operation.

### Revision 1.3 to Revision 1.4

- Removed references to LGA8 throughout.
- Deleted all IEC 60747-5 and IEC 61010 references throughout and added VDE 0884-10 references throughout.
- Updated all certification body's certificate and file reference numbers throughout.

### Revision 1.4 to Revision 1.5

- Added Automotive-grade Ordering Guide and other introductory information.

### Revision 1.5 to Revision 1.51

- Added Automotive-grade Ordering Guide
  - Si8261BBC-AP
  - Si8261BCC-AS
  - Si8261BCD-AS
