## 1 Overview

### Features

- Wide Input Voltage Range from 3.0 V to 40 V
- Fixed Output Voltage 5 V
- Output Voltage Precision  $\leq \pm 2\%$
- Output Current Capability up to 500 mA
- Ultra Low Current Consumption typ. 40  $\mu$ A
- Very Low Dropout Voltage typ. 70 mV@100 mA
- Stable with Ceramic Output Capacitor of 1  $\mu$ F
- Delayed Reset at Power-On: 8.5 ms
- Adjustable Reset Threshold down to 2.50 V
- Watchdog with fixed timing: 48 ms
- Enable, Undervoltage Reset, Overtemperature Shutdown
- Output Current Limitation
- Wide Temperature Range
- Green Product (RoHS compliant)
- AEC Qualified

Figure 1 PG-TO263-7

## Functional Description

The TLS850F1TAV50 is a high performance very low dropout linear voltage regulator for 5 V supply in a PG-TO263-7 package.

With an input voltage range of 3 V to 40 V and very low quiescent of only 40  $\mu$ A, these regulators are perfectly suitable for automotive or any other supply systems connected to the battery permanently. The TLS850F1TAV50 provides an output voltage accuracy of 2 % and a maximum output current up to 500 mA.

The new loop concept combines fast regulation and very good stability while requiring only one small ceramic capacitor of 1  $\mu$ F at the output. At currents below 100 mA the device will have a very low typical dropout voltage of only 70 mV. The operating range starts already at input voltages of only 3 V (extended operating range). This makes the TLS850F1TAV50 also suitable to supply automotive systems that need to operate during cranking condition.

The device can be switched on and off by the Enable feature as described in [Chapter 5.5](#).

The output voltage is supervised by the Reset feature, including Undervoltage Reset, delayed Reset at Power-On and an adjustable lower Reset Threshold, more details can be found in [Chapter 5.7](#).

In addition, a Watchdog circuit with fixed timing is integrated to monitor the microcontroller's operation.

Internal protection features like output current limitation and overtemperature shutdown are implemented to protect the device against immediate damage due to failures like output short circuit to GND, over-current and over-temperatures.

## Choosing External Components

An input capacitor  $C_I$  is recommended to compensate line influences. The output capacitor  $C_O$  is necessary for the stability of the regulating circuit. TLS850F1TAV50 is designed to be also stable with low ESR ceramic capacitors.

Type	Package	Marking
TLS850F1TAV50	PG-TO263-7	850F1V50

## 2 Block Diagram

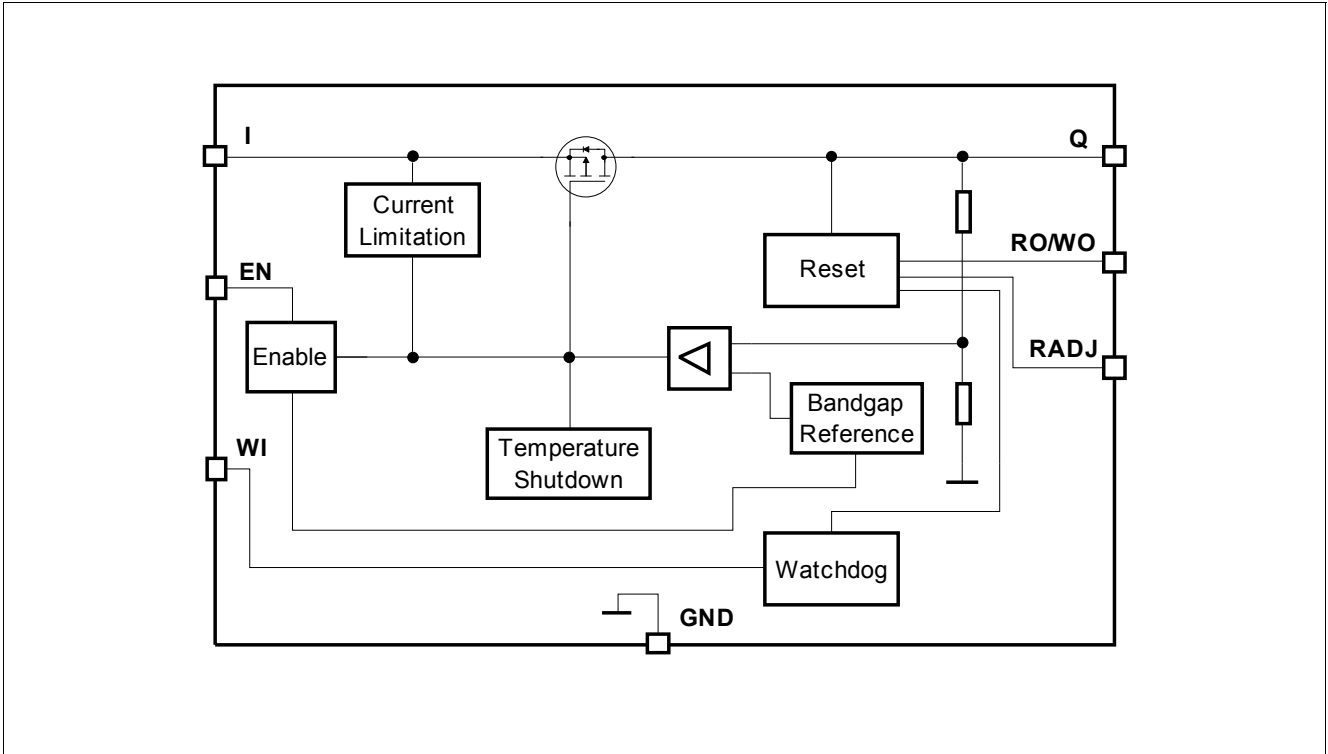

Figure 2 Block Diagram TLS850F1TAV50

### 3 Pin Configuration

#### 3.1 Pin Assignment TLS850F1TAV50

Figure 3 Pin Configuration

#### 3.2 Pin Definitions and Functions TLS850F1TAV50

Pin	Symbol	Function
1	I	<b>Input</b> It is recommended to place a small ceramic capacitor (e.g. 100 nF) to GND, close to the IC terminals, in order to compensate line influences. See also <a href="#">Chapter 6.2.1</a>
2	EN	<b>Enable</b> (integrated pull-down resistor) Enable the IC with high level input signal; Disable the IC with low level input signal;
3	RO/WO	<b>Reset Output / Watchdog Output</b> (intergrated pull-up resistor to Q) Open collector output; Leave open if the reset and watchdog function are not needed
4	GND	<b>Ground</b>
5	RADJ	<b>Reset Threshold Adjustment</b> Connect to GND to use standard value; Connect an external voltage divider to adjust reset threshold
6	WI	<b>Watchdog Input</b> (integrated pull-down resistor) Serve Watchdog with trigger input signal (usable for microcontroller monitoring)
7	Q	<b>Output Voltage</b> Connect output capacitor $C_Q$ to GND close to the IC's terminals, respecting the values specified for its capacitance and ESR in <a href="#">"Functional Range" on Page 8</a>
Heat Slug	–	<b>Heat Slug</b> Connect to heatsink area; Connect to GND

## 4 General Product Characteristics

### 4.1 Absolute Maximum Ratings

**Table 1 Absolute Maximum Ratings<sup>1)</sup>**
 $T_j = -40\text{ °C to }+150\text{ °C}$ ; all voltages with respect to ground (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
<b>Input I, Enable EN</b>							
Voltage	$V_I, V_{EN}$	-0.3	–	45	V	–	P_4.1.1
<b>Output Q, Reset/Watchdog Output RO/WO</b>							
Voltage	$V_Q, V_{RO/WO}$	-0.3	–	7	V	–	P_4.1.3
<b>Watchdog Input WI, Reset Threshold Adjustment RADJ</b>							
Voltage	$V_{WI}, V_{RADJ}$	-0.3	–	7	V	–	P_4.1.5
<b>Temperatures</b>							
Junction Temperature	$T_j$	-40	–	150	°C	–	P_4.1.7
Storage Temperature	$T_{stg}$	-55	–	150	°C	–	P_4.1.8
<b>ESD Absorption</b>							
ESD Susceptibility to GND	$V_{ESD}$	-2	–	2	kV	<sup>2)</sup> HBM	P_4.1.9
ESD Susceptibility to GND	$V_{ESD}$	-500	–	500	V	<sup>3)</sup> CDM	P_4.1.10
ESD Susceptibility Pin 1, 7 (corner pins) to GND	$V_{ESD1,7}$	-750	–	750	V	<sup>3)</sup> CDM	P_4.1.12

1) Not subject to production test, specified by design.

2) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS001 (1.5 kΩ, 100 pF)

3) ESD susceptibility, Charged Device Model “CDM” according JEDEC JESD22-C101

**Note:**

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

## 4.2 Functional Range

**Table 2 Functional Range**
 $T_j = -40\text{ °C to }+150\text{ °C}$ ; all voltages with respect to ground (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Input Voltage Range	$V_I$	$V_{Q,nom} + V_{dr}$	–	40	V	<sup>1)</sup> –	P_4.2.1
Extended Input Voltage Range	$V_{I,ext}$	3.0	–	40	V	<sup>2)</sup> –	P_4.2.3
Enable Voltage Range	$V_{EN}$	0	–	40	V	–	P_4.2.5
Output Capacitor's Requirements for Stability	$C_Q$	1	–	–	μF	<sup>3)4)</sup> –	P_4.2.6
ESR	$ESR(C_Q)$	–	–	100	Ω	<sup>3)</sup> –	P_4.2.7
Junction Temperature	$T_j$	-40	–	150	°C	–	P_4.2.9

1) Output current is limited internally and depends on the input voltage, see Electrical Characteristics for more details.

2) When  $V_I$  is between  $V_{I,ext,min}$  and  $V_{Q,nom} + V_{dr}$ ,  $V_Q = V_I - V_{dr}$ . When  $V_I$  is below  $V_{I,ext,min}$ ,  $V_Q$  can drop down to 0 V.

3) Not subject to production test, specified by design.

4) The minimum output capacitance requirement is applicable for a worst case capacitance tolerance of 30%

*Note: Within the functional or operating range, the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics table.*

### 4.3 Thermal Resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to [www.jedec.org](http://www.jedec.org).

**Table 3 Thermal Resistance**

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
<b>Package Version PG-TO263-7</b>							
Junction to Case	$R_{thJC}$	–	3	–	K/W	<sup>1)</sup> –	P_4.3.6
Junction to Ambient	$R_{thJA}$	–	21	–	K/W	<sup>1)2)</sup> 2s2p board	P_4.3.7
Junction to Ambient	$R_{thJA}$	–	75	–	K/W	<sup>1)3)</sup> 1s0p board, footprint only	P_4.3.8
Junction to Ambient	$R_{thJA}$	–	42	–	K/W	<sup>1)3)</sup> 1s0p board, 300 mm <sup>2</sup> heatsink area on PCB	P_4.3.9
Junction to Ambient	$R_{thJA}$	–	34	–	K/W	<sup>1)3)</sup> 1s0p board, 600 mm <sup>2</sup> heatsink area on PCB	P_4.3.10

- 1) Not subject to production test, specified by design
- 2) Specified  $R_{thJA}$  value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The Product (Chip+Package) was simulated on a 76.2 x 114.3 x 1.5 mm<sup>3</sup> board with 2 inner copper layers (2 x 70µm Cu, 2 x 35µm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.
- 3) Specified  $R_{thJA}$  value is according to JEDEC JESD 51-3 at natural convection on FR4 1s0p board; The Product (Chip+Package) was simulated on a 76.2 x 114.3 x 1.5 mm<sup>3</sup> board with 1 copper layer (1 x 70µm Cu).

## 5 Block Description and Electrical Characteristics

### 5.1 Voltage Regulation

The output voltage  $V_Q$  is divided by a resistor network. This fractional voltage is compared to an internal voltage reference and the pass transistor is driven accordingly.

The control loop stability depends on the output capacitor  $C_Q$ , the load current, the chip temperature and the internal circuit design. To ensure stable operation, the output capacitor's capacitance and its equivalent series resistor (ESR) requirements given in **“Functional Range” on Page 8** have to be maintained. For details, also see the typical performance graph **“Output Capacitor Series Resistor ESR(CQ) versus Output Current IQ” on Page 13**. As the output capacitor also has to buffer load steps, it should be sized according to the application's needs.

An input capacitor  $C_I$  is recommended to compensate line influences. In order to block influences like pulses and HF distortion at input side, an additional reverse polarity protection diode and a combination of several capacitors for filtering should be used. Connect the capacitors close to the component's terminals.

In order to prevent overshoots during start-up, a smooth ramp up function is implemented. This ensures almost no output voltage overshoots during start-up, mostly independent from load and output capacitance.

Whenever the load current exceeds the specified limit, e.g. in case of a short circuit, the output current is limited and the output voltage decreases.

The overtemperature shutdown circuit prevents the IC from immediate destruction under fault conditions (e.g. output continuously short-circuit) by switching off the power stage. After the chip has cooled down, the regulator restarts. This leads to an oscillatory behavior of the output voltage until the fault is removed. However, junction temperatures above 150 °C are outside the maximum ratings and therefore significantly reduce the IC's lifetime.

Figure 4 Voltage Regulation

Figure 5 Output Voltage vs. Input Voltage

**Block Description and Electrical Characteristics**
**Table 4 Electrical Characteristics Voltage Regulator 5 V version**

$T_j = -40\text{ °C}$  to  $+150\text{ °C}$ ,  $V_I = 13.5\text{ V}$ , all voltages with respect to ground (unless otherwise specified)  
 Typical values are given at  $T_j = 25\text{ °C}$

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Output Voltage Precision	$V_Q$	4.9	5.0	5.1	V	$0.05\text{ mA} < I_Q < 500\text{ mA}$ $5.95\text{ V} < V_I < 28\text{ V}$	P_5.1.3
Output Voltage Precision	$V_Q$	4.9	5.0	5.1	V	$0.05\text{ mA} < I_Q < 200\text{ mA}$ $5.44\text{ V} < V_I < 40\text{ V}$	P_5.1.4

Overtemperature Shutdown Threshold Hysteresis	$T_{j,sdh}$	–	15	–	K	<sup>2)</sup> $T_j$ decreasing	P_5.1.20

1) Measured when the output voltage  $V_Q$  has dropped 100 mV from the nominal value obtained at  $V_I = 13.5\text{ V}$

2) Not subject to production test, specified by design

## 5.2 Typical Performance Characteristics Voltage Regulator

### Typical Performance Characteristics

Output Voltage  $V_Q$  versus Junction Temperature  $T_j$

Dropout Voltage  $V_{dr}$  versus Junction Temperature  $T_j$

Load Regulation  $\Delta V_{Q,load}$  versus Output Current Change  $I_Q$

Line Regulation  $\Delta V_{Q,line}$  versus Input Voltage  $V_I$

Output Voltage  $V_Q$  versus Input Voltage  $V_I$

Power Supply Ripple Rejection  $PSRR$  versus ripple frequency  $f$

Output Capacitor Series Resistor  $ESR(C_Q)$  versus Output Current  $I_Q$

Maximum Output Current  $I_{Q,max}$  versus Input Voltage  $V_I$

**Dropout Voltage  $V_{dr}$  versus  
Output Current  $I_Q$** 

### 5.3 Current Consumption

**Table 5 Electrical Characteristics Current Consumption**
 $T_j = -40\text{ °C to }+150\text{ °C}$ ,  $V_I = 13.5\text{ V}$  (unless otherwise specified)

 Typical values are given at  $T_j = 25\text{ °C}$ 

Conditions of other pins: WI = GND

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Current Consumption $I_q = I_I$	$I_{q,off}$	–	1.3	5	μA	$V_{EN} = 0\text{ V}$ ; $T_j < 105\text{ °C}$	P_5.3.1
Current Consumption $I_q = I_I$	$I_{q,off}$	–	–	8	μA	$V_{EN} = 0.4\text{ V}$ ; $T_j < 125\text{ °C}$	P_5.3.3
Current Consumption $I_q = I_I - I_Q$	$I_q$	–	40	52	μA	$I_Q = 0.05\text{ mA}$ $T_j = 25\text{ °C}$ Watchdog enabled	P_5.3.4
Current Consumption $I_q = I_I - I_Q$	$I_q$	–	62	77	μA	$I_Q = 0.05\text{ mA}$ $T_j < 125\text{ °C}$ Watchdog enabled	P_5.3.7
Current Consumption $I_q = I_I - I_Q$	$I_q$	–	62	82	μA	<sup>1)</sup> $I_Q = 500\text{ mA}$ $T_j < 125\text{ °C}$ Watchdog enabled	P_5.3.11

1) Not subject to production test, specified by design

### 5.4 Typical Performance Characteristics Current Consumption

#### Typical Performance Characteristics

Current Consumption  $I_q$  versus Output Current  $I_Q$

Current Consumption  $I_q$  versus Input Voltage  $V_I$

## 5.5 Enable

The TLS850F1TAV50 can be switched on and off by the Enable feature: Connect a HIGH level as specified below (e.g. the battery voltage) to pin EN to enable the device; connect a LOW level as specified below (e.g. GND) to shut it down. The enable has a built in hysteresis to avoid toggling between ON/OFF state, if signals with slow slopes are applied to the EN input.

**Table 6 Electrical Characteristics Enable**

$T_j = -40\text{ °C}$  to  $+150\text{ °C}$ ,  $V_i = 13.5\text{ V}$ , all voltages with respect to ground (unless otherwise specified)  
Typical values are given at  $T_j = 25\text{ °C}$

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
High Level Input Voltage	$V_{EN,H}$	2	–	–	V	$V_Q$ settled	P_5.5.1
Low Level Input Voltage	$V_{EN,L}$	–	–	0.8	V	$V_Q \leq 0.1\text{ V}$	P_5.5.2
Enable Threshold Hysteresis	$V_{EN,Hy}$	100	–	–	mV	–	P_5.5.3
High Level Input Current	$I_{EN,H}$	–	–	3.5	$\mu\text{A}$	$V_{EN} = 3.3\text{ V}$	P_5.5.4
High Level Input Current	$I_{EN,H}$	–	–	22	$\mu\text{A}$	$V_{EN} \leq 18\text{ V}$	P_5.5.6
Enable internal pull-down resistor	$R_{EN}$	0.95	1.5	2.6	M $\Omega$	–	P_5.5.7

## 5.6 Typical Performance Characteristics Enable

### Typical Performance Characteristics

**Input Current  $I_{IN}$  versus Input Voltage  $V_{IN}$  (condition:  $V_{EN} = 0V$ )**

**Enabled Input Current  $I_{EN}$  versus Enabled Input Voltage  $V_{EN}$**

**Output Voltage  $V_Q$  versus time (EN switched ON)**

### 5.7 Reset

The TLS850F1TAV50's output voltage is supervised by the Reset feature, including Undervoltage Reset, delayed Reset at Power-On and an adjustable Reset Threshold.

The Undervoltage Reset function sets the pin RO/WO to LOW, in case  $V_Q$  is falling for any reason below the Reset Threshold  $V_{RT,low}$ .

When the regulator is powered on, the pin RO/WO is held at LOW for the duration of the Power-On Reset Delay Time  $t_{rd}$ .

Figure 6 Block Diagram Reset Circuit

#### Reset Delay Time

The Reset Delay Time  $t_{rd}$  is fix defined according to [Table 7](#).

Table 7 Reset DelayTime

Reset delay timing	$t_{rd}$
fix	8.5 ms

#### Power-On Reset Delay Time

The power-on reset delay time is defined by the parameter  $t_{rd}$  and allows a microcontroller and oscillator to start up. This delay time is the time period from exceeding the upper reset switching threshold  $V_{RT,high}$  until the reset is released by switching the reset output “RO/WO” from “LOW” to “HIGH”.

#### Undervoltage Reset Delay Time

Unlike the power-on reset delay time, the undervoltage reset delay time is defined by the parameter  $t_{rd}$  and considers an output undervoltage event where the output voltage  $V_Q$  trigger the  $V_{RT,low}$  threshold.

#### Reset Blanking Time

The reset blanking time  $t_{tr,blank}$  avoids that short undervoltage spikes trigger an unwanted reset “low” signal.

### Reset Reaction Time

In case the output voltage of the regulator drops below the output undervoltage lower reset threshold  $V_{RT,low}$ , the reset output “RO/WO” is set to low, after the delay of the internal reset reaction time  $t_{rr,int}$ . The reset blanking time  $t_{rr,blank}$  is part of the reset reaction time  $t_{rr,int}$ .

### Reset Output “RO/WO”

The reset output “RO/WO” is an open collector output with an integrated pull-up resistor. In case a lower-ohmic “RO/WO” signal is desired, an external pull-up resistor can be connected to the output “Q”. Since the maximum “RO/WO” sink current is limited, the minimum value of the optional external resistor “ $R_{RO/WO,ext}$ ” is given in [Table “Reset Output / Watchdog Output RO/WO” on Page 22](#).

### Reset Output “RO/WO” Low for $V_Q \geq 1$ V

In case of an undervoltage reset condition reset output “RO/WO” is held “low” for  $V_Q \geq 1$  V, even if the input voltage  $V_I$  is 0 V. This is achieved by supplying the reset circuit from the output capacitor.

### Reset Adjust Function

The undervoltage reset switching threshold can be adjusted according to the application’s needs by connecting an external voltage divider ( $R_{ADJ,1}$ ,  $R_{ADJ,2}$ ) at pin “RADJ”. For selecting the default threshold connect pin “RADJ” to GND. The reset adjustment range for the TLS850F1TAV50 is given in [Reset Threshold Adjustment Range](#).

When dimensioning the voltage divider, take into consideration that there will be an additional current constantly flowing through the resistors.

With a voltage divider connected, the reset switching threshold  $V_{RT,new}$  is calculated as follows (neglecting the Reset Adjust Pin Current  $I_{RADJ}$ ):

$$V_{RT,lo,new} = V_{RADJ,th} \times (R_{ADJ,1} + R_{ADJ,2}) / R_{ADJ,2} \quad (1)$$

with

- $V_{RT,lo,new}$ : Desired undervoltage reset switching threshold.
- $R_{ADJ,1}$ ,  $R_{ADJ,2}$ : Resistors of the external voltage divider, see [Figure 6](#).
- $V_{RADJ,th}$ : Reset adjust switching threshold given in [Reset Adjustment Switching Threshold](#).

Block Description and Electrical Characteristics

Figure 7 Typical Timing Diagram Reset

## Block Description and Electrical Characteristics

**Table 8 Electrical Characteristics Reset**

$T_j = -40\text{ °C}$  to  $+150\text{ °C}$ ,  $V_I = 13.5\text{ V}$ , all voltages with respect to ground (unless otherwise specified)  
 Typical values are given at  $T_j = 25\text{ °C}$

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
<b>Output Undervoltage Reset 5V Version only</b>							
Output Undervoltage Reset Upper Switching Threshold	$V_{RT,high}$	4.6	4.7	4.8	V	$V_Q$ increasing	P_5.7.1
Output Undervoltage Reset Lower Switching Threshold - Default	$V_{RT,low}$	4.5	4.6	4.7	V	$V_Q$ decreasing RADJ = GND	P_5.7.2
Output Undervoltage Reset Switching Hysteresis	$V_{RT,hy}$	60	100	–	mV	RADJ connected to GND	P_5.7.3
Output Undervoltage Reset Headroom $V_Q - V_{RT}$	$V_{RH}$	200	400	–	mV	RADJ = GND	P_5.7.4
<b>Reset Threshold Adjustment</b>							
Reset Adjustment Switching Threshold	$V_{RADJ,th}$	1.15	1.20	1.25	V	–	P_5.7.9

<b>Reset Output / Watchdog Output RO/WO</b>							
Reset Output Watchdog Output Low Voltage	$V_{RO/WO,low}$	–	0.2	0.4	V	$1\text{ V} \leq V_Q \leq V_{RT}$ ; $R_{RO/WO} \geq 5.1\text{ k}\Omega$	P_5.7.16
Reset Output Watchdog Output Internal Pull-Up Resistor	$R_{RO/WO,int}$	13	20	36	k $\Omega$	internally connected to Q	P_5.7.17
Reset Output Watchdog Output External Pull-up Resistor to $V_Q$	$R_{RO/WO,ext}$	5.1	–	–	k $\Omega$	$1\text{ V} \leq V_Q \leq V_{RT}$ ; $V_{RO/WO} \leq 0.4\text{ V}$	P_5.7.18
<b>Reset Delay Timing</b>							
Reset Delay Time	$t_{rd}$	6.8	8.5	10.2	ms	Fixed Timing	P_5.7.45
Reset blanking time	$t_{rr,blank}$	–	7	–	$\mu\text{s}$	<sup>1)</sup> for $V_{Q,nom} = 5\text{ V}$	P_5.7.46
Internal Reset Reaction Time	$t_{rr,int}$	–	10	33	$\mu\text{s}$	for $V_{Q,nom} = 5\text{ V}$	P_5.7.36

1) Not subject to production test, specified by design.

## 5.8 Typical Performance Characteristics Reset

### Typical Performance Characteristics

Undervoltage Reset Threshold  $V_{RT}$  versus Junction Temperature  $T_j$

Power On Reset Delay Time  $t_{rd}$  versus Junction Temperature  $T_j$

Internal Reset Reaction Time  $t_{rr, \text{int}}$  versus Junction Temperature  $T_j$

### 5.9 Standard Watchdog

The watchdog function monitors a microcontroller, including time base failures. In case of a missing falling edge within a certain pulse repetition time, the watchdog output “RO/WO” is set to “low”.

The watchdog uses an internal oscillator as timebase. The effective trigger window is derived from the watchdog timebase.

The watchdog output signal is provided by a combined Reset Output / Watchdog Output “RO/WO” pin.

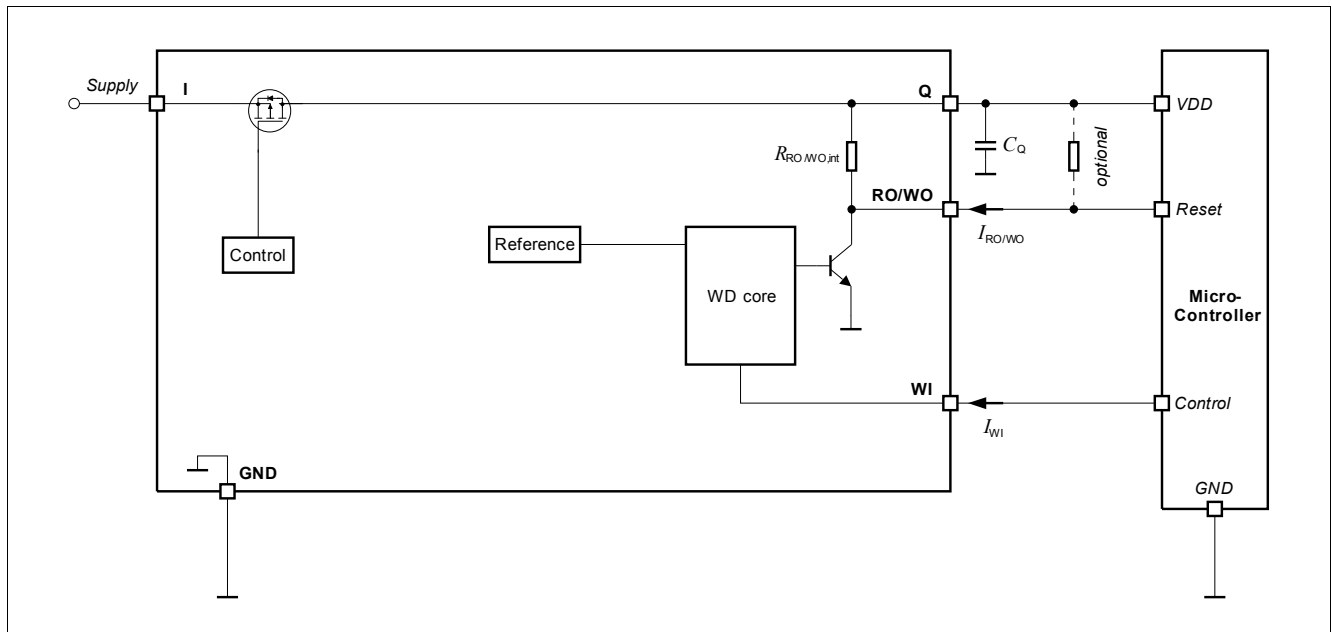

Figure 8 Block Diagram Watchdog Circuit

#### Watchdog Timing

Figure 9 shows the state diagram of the watchdog (WD) and the mode selection. After power-on, the reset output signal at the “RO/WO” pin (microcontroller reset) is kept LOW for the reset delay time  $t_{rd}$ . With the LOW to HIGH transition of the signal at “RO/WO” the device starts the watchdog ignore time  $t_{WI,i}$ . Next, the WD starts the watchdog trigger time (time frame within a trigger at WI must occur).

From now on, the timing of the signal on WI from the microcontroller must fit to the WD-trigger time  $t_{WI,tr}$ . A Re-Trigger of the WD-trigger time is done with a HIGH-to-LOW transient at the WI-pin within the active  $t_{WI,tr}$ .

#### Watchdog Output “RO/WO”

The watchdog output “RO/WO” is an open collector output with an integrated pull-up resistor. In case a lower-ohmic “RO/WO” signal is desired, an external pull-up resistor can be connected to the output “Q”. Since the maximum “RO/WO” sink current is limited, the minimum value of the optional external resistor “ $R_{RO/WO,ext}$ ” is given in Table “Reset Output / Watchdog Output RO/WO” on Page 22. A HIGH to LOW transition of the watchdog trigger signal on pin WI is taken as a trigger. A watchdog signal is generated (“RO/WO” goes LOW), if there is no trigger pulse during the Watchdog trigger time.

Figure 9 Typical Watchdog Timing Diagram, Watchdog and Reset Modes

### Watchdog Input “WI”

The watchdog is triggered by a falling edge at the watchdog input pin “WI”. The amplitude and slope of this signal has to comply with the specification (Table “Watchdog Input WI” on Page 26). For details regarding test pulses, see Figure 10 “Test Pulses Watchdog Input WI” on Page 25.

Figure 10 Test Pulses Watchdog Input WI

## Block Description and Electrical Characteristics

**Table 9 Electrical Characteristics Watchdog**

$T_j = -40\text{ °C}$  to  $+150\text{ °C}$ ,  $V_I = 13.5\text{ V}$ , all voltages with respect to ground (unless otherwise specified)  
 Typical values are given at  $T_j = 25\text{ °C}$

Parameter	Symbol	Values			Unit	Note / Test Condition	Number

2) Not subject to production test, specified by design.

**Watchdog Trigger Time**

The Watchdog Trigger Time  $t_{WI,tr}$  is fixed to a static value according to [Table 10](#).

**Table 10 Watchdog Trigger Time**

Watchdog trigger timing	$t_{WI,tr,typ}$
fix to	48 ms

**Watchdog deactivation by external signal (pin “WI”)**

*Note: Disabling the watchdog should only be considered when the application is not running in the normal operating conditions as the safe operation is not ensured any more. Example would be the flashing process of the microcontroller.*

The Watchdog can be disabled by connecting a voltage level between the range of 1.15 V to 1.40 V to WI. By entering the Watchdog deactivation, the “RO/WO” signal behaves like it is described in **Figure 11**. The transition from active to an inactive state will be performed after a dead time of  $t_{WI,filter,max}$ , when correct level to WI pin is applied. This protects against the unintended entering of watchdog deactivation state. After leaving the deactivation voltage range 1.15 V to 1.40 V, the Watchdog is again active and starts with an ignore window. This scenario is also valid for the transition from deactivation to activation state.

**Figure 11 Watchdog Output behavior for Watchdog deactivation by WI pin**

**Scenario “A”**

In scenario “A” the watchdog logic expects a next trigger at WI pin within the WD-trigger time  $t_{WI,tr}$ . This state is interrupted by setting  $V_{WI}$  to the disable condition ( $V_{WI,dis,low} \leq V_{WI} \leq V_{WI,dis,high}$ ). During this state, the watchdog is disabled. The watchdog output signal “RO/WO” will stay high while the watchdog is disabled. After leaving the disable condition ( $V_{WI} \geq V_{WI,dis,high}$  or  $V_{WI} \leq V_{WI,dis,low}$ ), an ignore window  $t_{WI,i}$  follows. After this, the watchdog trigger time  $t_{WI,tr}$  starts. This behavior is defined for cases with a low current load time greater than  $t_{WO,low}$ .

**Scenario “B”**

In scenario “B” the watchdog is not served within WD-trigger time  $t_{WI,tr}$  with a trigger event at WI pin. As a result the “RO/WO” is set to low. This state is interrupted by setting  $V_{WI}$  to the disable condition ( $V_{WI,dis,low} \leq V_{WI} \leq V_{WI,dis,high}$ ). During this state, the watchdog is disabled. The watchdog output signal “RO/WO” is kept in low state for  $t_{WO,low}$  and then the “RO/WO” is set to high. After leaving the disable condition ( $V_{WI} \geq V_{WI,dis,high}$  or  $V_{WI} \leq V_{WI,dis,low}$ ), an ignore window  $t_{WI,i}$  follows. After this, the watchdog trigger time  $t_{WI,tr}$  starts. This behavior is defined for cases with a low current load time greater than  $t_{WO,low}$ .

**Scenario “C”**

In scenario “C” the watchdog is not served within WD-trigger time  $t_{WI,tr}$  with a trigger event at WI pin. As a result the “RO/WO” is set to low. After this an ignore window follows. This state is interrupted by setting  $V_{WI}$  to the disable condition ( $V_{WI,dis,low} \leq V_{WI} \leq V_{WI,dis,high}$ ). During this state, the watchdog is disabled. The watchdog output signal “RO/WO” will stay high while the watchdog is disabled. After leaving the disable condition ( $V_{WI} \geq V_{WI,dis,high}$  or

---

**Block Description and Electrical Characteristics**

$V_{WI} \leq V_{WI,dis,low}$ ), an ignore window  $t_{WI,i}$  follows. After this, the watchdog trigger time  $t_{WI,tr}$  starts. This behavior is defined for cases with a low current load time greater than  $t_{WO,low}$ .

**Scenario “D”**

In scenario “D” the watchdog is not served within WD-trigger time  $t_{WI,tr}$  with a trigger event at WI pin. As a result the “RO/WO” is set to low. This state is interrupted by setting  $V_{WI}$  to the disable condition ( $V_{WI,dis,low} \leq V_{WI} \leq V_{WI,dis,high}$ ). During this state, the watchdog is disabled. The watchdog output signal “RO/WO” is kept in low state for the time of low current load state. After leaving the disable condition ( $V_{WI} \geq V_{WI,dis,high}$  or  $V_{WI} \leq V_{WI,dis,low}$ ), an ignore window  $t_{WI,i}$  follows. After this, the watchdog trigger time  $t_{WI,tr}$  starts. This behavior is defined for cases with a low current load time less than  $t_{WO,low}$ .

### 5.10 Typical Performance Characteristics Standard Watchdog

#### Typical Performance Characteristics

Watchdog Trigger Time  $t_{WI,tr}$  versus Junction Temperature  $T_j$

Watchdog Output Low Time  $t_{WO,low}$  versus Junction Temperature  $T_j$

Watchdog Disable  $V_{WI,dis}$  Threshold versus Junction Temperature  $T_j$

## 6 Application Information

### 6.1 Application Diagram

*Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.*

**Figure 12 Application Diagram**

*Note: This is a very simplified example of an application circuit. The function must be verified in the real application.*

### 6.2 Selection of External Components

#### 6.2.1 Input Pin

The typical input circuitry for a linear voltage regulator is shown in the application diagram above.

A ceramic capacitor at the input, in the range of 100 nF to 470 nF, is recommended to filter out the high frequency disturbances imposed by the line e.g. ISO pulses 3a/b. This capacitor must be placed very close to the input pin of the linear voltage regulator on the PCB.

An aluminum electrolytic capacitor in the range of 10 μF to 470 μF is recommended as an input buffer to smooth out high energy pulses, such as ISO pulse 2a. This capacitor should be placed close to the input pin of the linear voltage regulator on the PCB.

An overvoltage suppressor diode can be used to further suppress any high voltage beyond the maximum rating of the linear voltage regulator and protect the device against any damage due to over-voltage.

The external components at the input are not mandatory for the operation of the voltage regulator, but they are recommended in case of possible external disturbances.

#### 6.2.2 Output Pin

An output capacitor is mandatory for the stability of linear voltage regulators.

The requirement to the output capacitor is given in [“Functional Range” on Page 8](#). The graph [“Output Capacitor Series Resistor ESR\(CQ\) versus Output Current IQ” on Page 13](#) shows the stable operation range of the device.

TLS850F1TAV50 is designed to be also stable with low ESR capacitors. According to the automotive requirements, ceramic capacitors with X5R or X7R dielectrics are recommended.

The output capacitor should be placed as close as possible to the regulator's output and GND pins and on the same side of the PCB as the regulator itself.

In case of rapid transients of input voltage or load current, the capacitance should be dimensioned in accordance and verified in the real application that the output stability requirements are fulfilled.

### 6.3 Thermal Considerations

Knowing the input voltage, the output voltage and the load profile of the application, the total power dissipation can be calculated:

$$P_D = (V_I - V_Q) \times I_Q + V_I \times I_q \quad (2)$$

with

- $P_D$ : continuous power dissipation
- $V_I$ : input voltage
- $V_Q$ : output voltage
- $I_Q$ : output current
- $I_q$ : quiescent current

The maximum acceptable thermal resistance  $R_{thJA}$  can then be calculated:

$$R_{thJA,max} = (T_{j,max} - T_a) / P_D \quad (3)$$

with

- $T_{j,max}$ : maximum allowed junction temperature
- $T_a$ : ambient temperature

Based on the above calculation the proper PCB type and the necessary heat sink area can be determined with reference to the specification in [“Thermal Resistance” on Page 9](#).

#### Example

Application conditions:

$$V_I = 13.5 \text{ V}$$

$$V_Q = 5 \text{ V}$$

$$I_Q = 200 \text{ mA}$$

$$T_a = 85 \text{ °C}$$

Calculation of  $R_{thJA,max}$ :

$$\begin{aligned} P_D &= (V_I - V_Q) \times I_Q + V_I \times I_q && (V_I \times I_q \text{ can be neglected because of very low } I_q) \\ &= (13.5 \text{ V} - 5 \text{ V}) \times 200 \text{ mA} \\ &= 1.7 \text{ W} \end{aligned}$$

$$\begin{aligned} R_{thJA,max} &= (T_{j,max} - T_a) / P_D \\ &= (150 \text{ °C} - 85 \text{ °C}) / 1.7 \text{ W} = 38.24 \text{ K/W} \end{aligned}$$

As a result, the PCB design must ensure a thermal resistance  $R_{thJA}$  lower than 38.24 K/W. According to **“Thermal Resistance” on Page 9**, at least 600 mm<sup>2</sup> heatsink area is needed on the FR4 1s0p PCB, or the FR4 2s2p board can be used to ensure a proper cooling for the TLS850F1TAV50 in package.

#### **6.4 Reverse Polarity Protection**

TLS850F1TAV50 is not self protected against reverse polarity faults and must be protected by external components against negative supply voltage. An external reverse polarity diode is needed. The absolute maximum ratings of the device as specified in **“Absolute Maximum Ratings” on Page 7** must be kept.

#### **6.5 Further Application Information**

7 Package Outlines

Figure 13 PG-TO263-7

**Green Product (RoHS compliant)**

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
