CMOS 8-Bit Microcontroller

TMP87PH47U, TMP87PH47LU

The 87PH47/47L are a One-Time PROM microcontroller with low-power 128 K bits (16 Kbytes) electrically programmable read only memory for the 87C447/847/H47/847L/H47L system evaluation. The 87PH47/47L are pin compatible with the 87C447/847/H47/847L/H47L.

The operations possible with the 87C447/847/H47/847L/H47L can be performed by writing programs to PROM. The 87PH47/47L can write and verify in the same way as the TMM27256AD using an adaptor socket BM1194C and an EPROM programmer.

Operational Description

The following explains the 87PH47/47L hardware configuration and operation. The configuration and function of the 87PH47/47L are the same as those of the 87C447/847/H47/847L/H47L, except in that a one-time PROM is used instead of an on-chip mask ROM.

The 87PH47L are fully compatible with the TMP87PH47 except that operating voltage range is extended from 1.8 V to 4.0 V.

The 87PH47/47L are placed in the single-clock mode during reset. To use the dual-clock mode, the low-frequency oscillator should be turned on by executing [SET (SYSCR2). XTEN] instruction at the beginning of the program.

1. Operating Mode

The 87PH47/47L have two modes: MCU and PROM.

1.1 MCU Mode

The MCU mode is activated by fixing the TEST / VPP pin at low level.

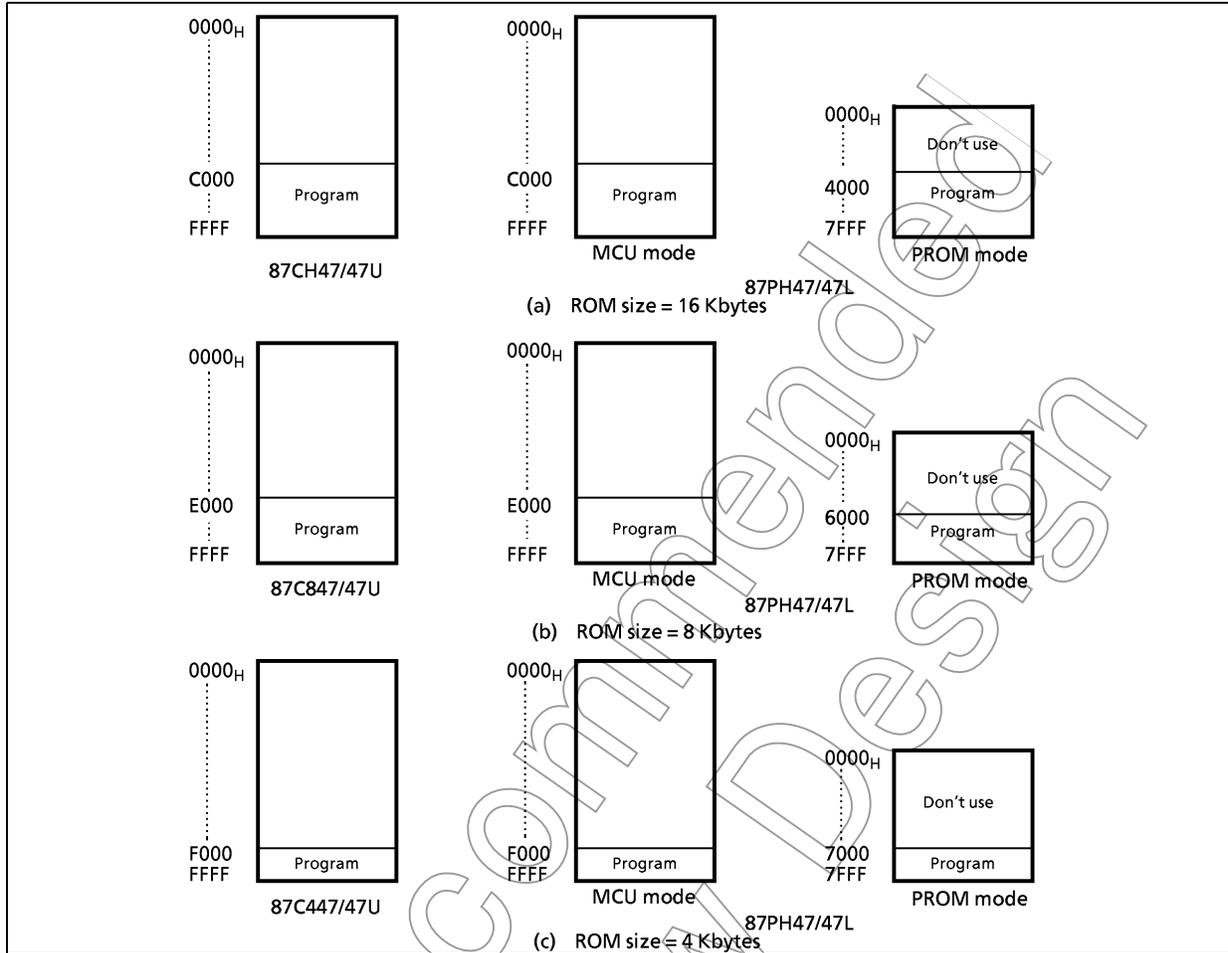

In the MCU mode, operation is the same as with the 87C447/847/H47/847L/H47L (the TEST / VPP pin cannot be used open because it has no built-in pull-down resistance).

1.1.1 Program Memory

The 87PH47/47L have a 16 K×8-bit (addresses C000_H to FFFF_H in the MCU mode, addresses 4000_H to 7FFF_H in the PROM mode) of program memory (OTP).

To use the PH47/47L as the system evaluation for the 87C447/C847/H47/847L/H47L, the program should be written to the program memory area as shown in Figure 1-1.

Not Recommended for New Design

Note: Either write the data FF_H to the unused area or set the PROM programmer to access only the program storage area.

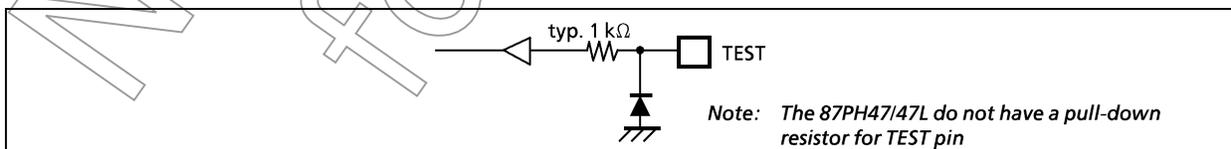

1.1.2 Data Memory

The 87PH47/47L have an on-chip 512 × 8-bit data memory (static RAM).

1.1.3 Input/Output Circuitry

(1) Control pins

The control pins of the 87PH47/47L are the same as those of the 87C447/847/H47/847L/H47L except that the TEST pin has no built-in pull-down resistance.

(2) I/O ports

The I/O circuitries of 87PH47/47L I/O ports are the same as the code A type I/O circuitries of the 87C447/847/H47/847L/H47L.

1.2 PROM Mode

The PROM mode is activated by setting the TEST, $\overline{\text{RESET}}$ pin and the ports P17-P10, P22-P20 and P77 as shown in Figure 1-3. The PROM mode is used to write and verify programs with a general-purpose PROM programmer. The high-speed programming mode can be used for program operation.

The 87PH47/47L are not supported an *electric signature mode*, so the ROM type must be set to TC57256AD.

Set the adaptor socket switch to "N".

Note: Please set the high-speed programming mode according to each manual of PROM programmer.

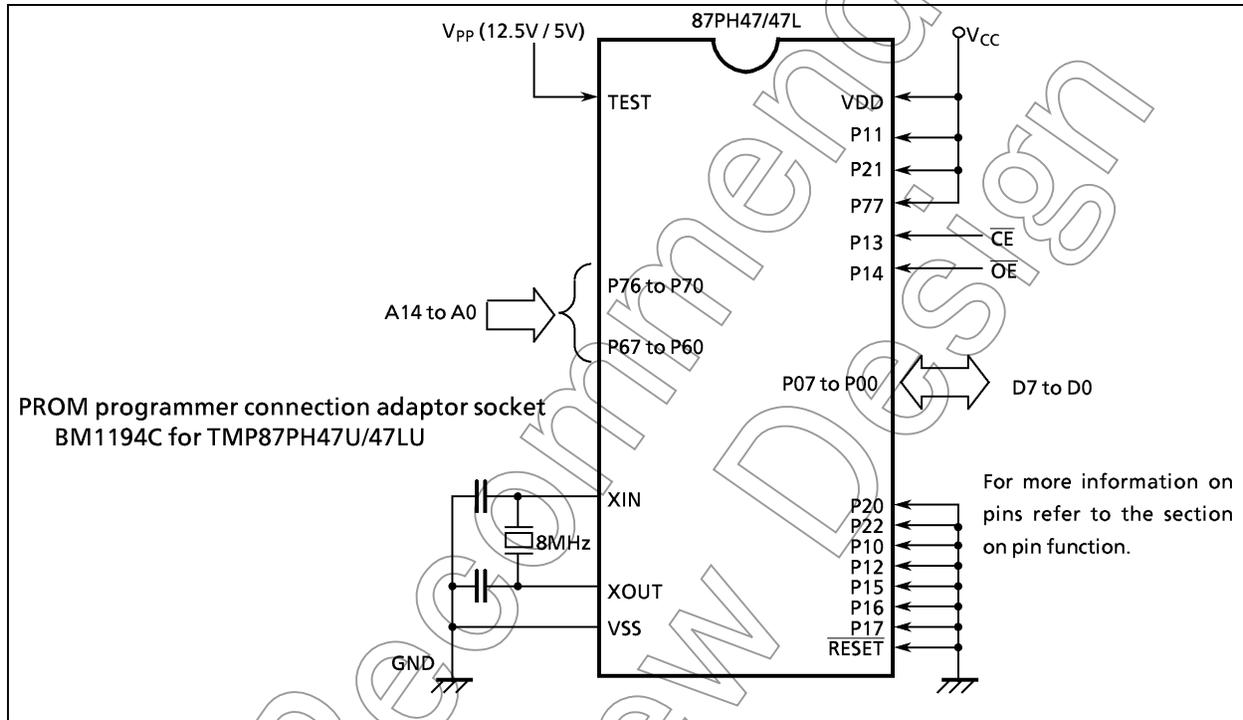

Figure 1-3. Setting for PROM Mode

1.2.1 Programming Flowchart (High-speed Programming Mode-I)

The high-speed programming mode is achieved by applying the program voltage (+ 12.5 V) to the Vpp pin when Vcc = 6 V. After the address and input data are stable, the data is programmed by applying a single 1ms program pulse to the CE input. The programmed data is verified. If incorrect, another 1ms program pulse is applied and then the programmed data is verified. This process should be repeated (up to 25 times) until the program operates correctly. Programming for one address is ended by applying additional program pulse with width 3 times that needed for initial programming (number of programmed times × 1 ms). After that, change the address and input data, and program as before. When programming has been completed, the data in all addresses should be verified with Vcc = Vpp = 5 V. When programming has been completed, the data in all addresses should be verified with Vcc = Vpp = 5 V.

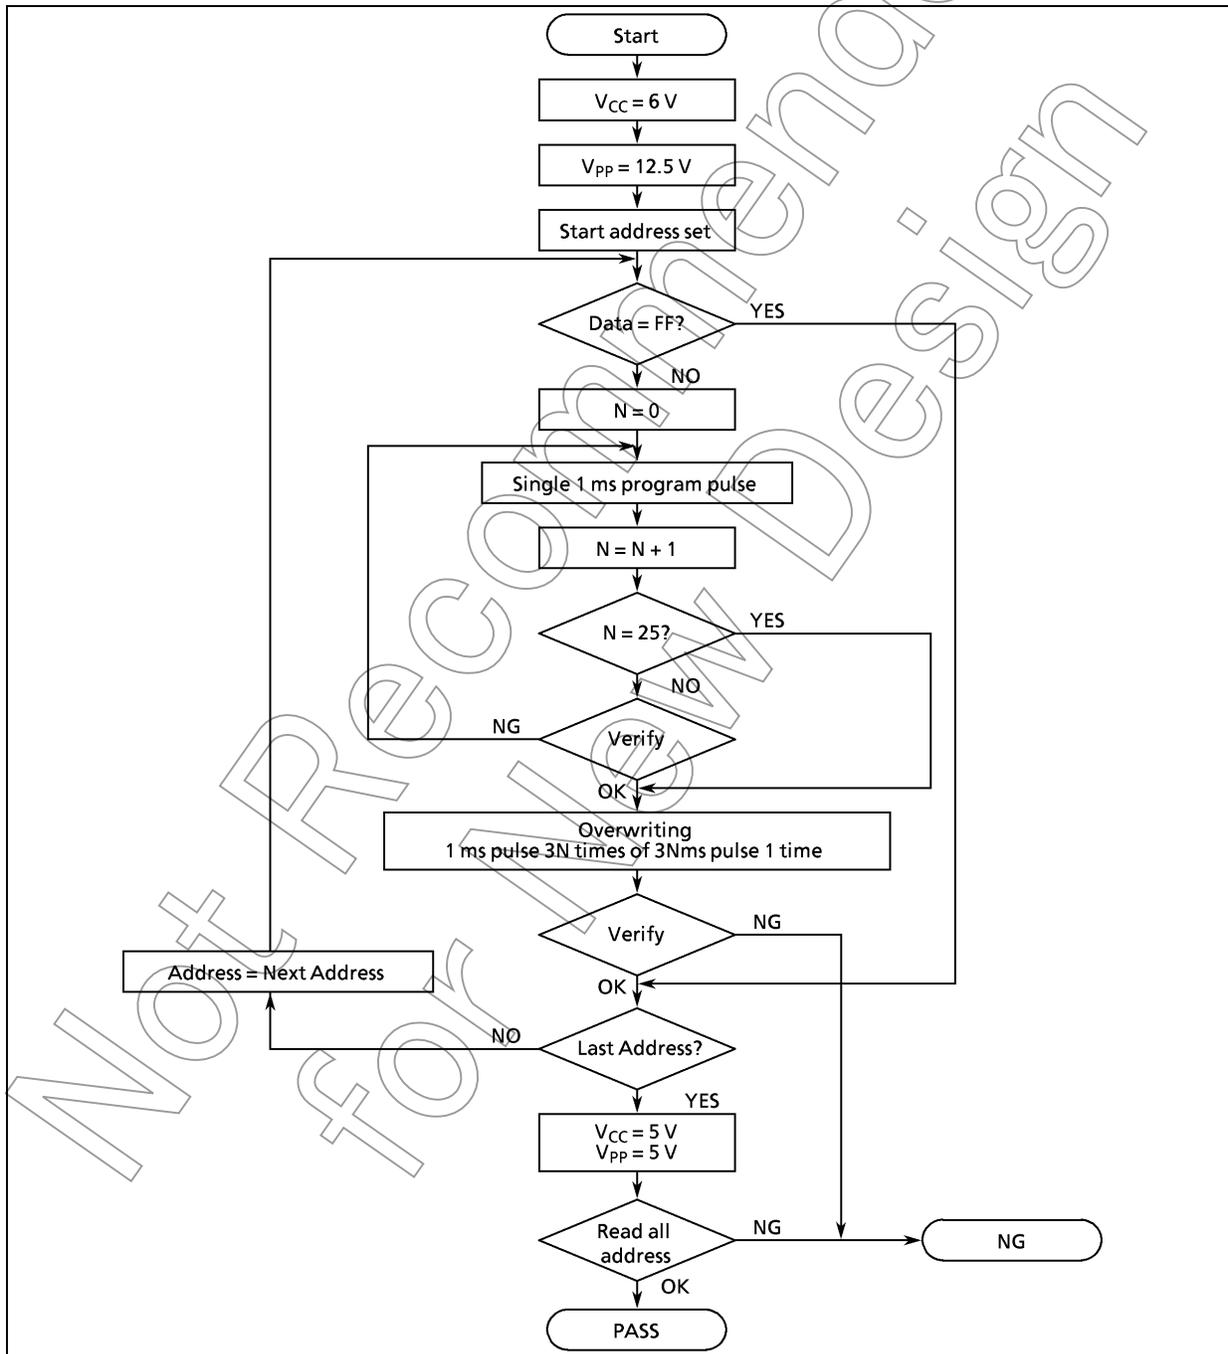

Figure 1-4. Flowchart of High-speed Programming Mode - I

1.2.2 Programming Flowchart (High-speed Programming Mode-II)

The high-speed programming mode is achieved by applying the program voltage (+ 12.75 V) to the Vpp pin when Vcc = 6.25 V. After the address and input data are stable, the data is programmed by applying a single 0.1ms program pulse to the CE input. The programmed data is verified. If incorrect, another 0.1ms program pulse is applied and then the programmed data is verified. This process should be repeated (up to 25 times) until the program operates correctly. After that, change the address and input data, and program as before. When programming has been completed, the data in all addresses should be verified with Vcc = Vpp = 5 V.

1.2.3 Writing Method for General-purpose PROM Program

- (1) Adapters
BM1194C: TMP87PH47U, TMP87PH47LU
- (2) Adapter setting
Switch (SW1) is set to side N.
- (3) PROM programmer specifying
 - i) PROM type is specified to TC57256AD.
Writing voltage: 12.5 V (high-speed program I mode)
12.75 V (high-speed program II mode)
 - ii) Data transfer (copy) (note 1)
In TMP87PH47/47L, EPROM is within the addresses 4000 to 7FFFH. Data is required to be transferred (copied) to the addresses where it is possible to write. The program area in MCU mode and PROM mode is referred to "Program memory area" in figure 1-1.

Ex. In the block transfer (copy) mode, executed as below.
ROM capacity of 16KB: transferred addresses C000 to FFFFH to addresses 4000 to 7FFFH
 - iii) Writing address is specified. (note 1)
Start address: 4000H
End address: 7FFFH
- (4) Writing
Writing/Verifying is required to be executed in accordance with PROM programmer operating procedure.

Note 1: The specifying method is referred to the PROM programmer description. The data in addresses 0000 to 3FFFH must be specified to FFH.

Note 2: When MCU is set to an adapter or the adapter is set to PROM programmer, a position of pin 1 must be adjusted. If the setting is reversed, MCU, the adapter and PROM program is damaged.

Note 3: TMP87PH47/47L do not support the electric signature mode (hereinafter referred to as "signature"). If the signature is used in PROM program, a device is damaged due to applying $12\text{V} \pm 0.5\text{V}$ to the address pin 9 (A9). The signature must not be used.

Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to

Note 2: Clock frequency fc ; Supply voltage range is specified in NORMAL mode and IDLE mode.
